## **APPENDIX**

*February 17, 2020*

## Table of Contents

Appendix A. Algorithm For Article Selection .....	1
Appendix B. Search Strategies .....	2
Appendix C. Excluded Articles.....	4
Appendix D. Risk Of Bias, Class Of Evidence, Strength Of Evidence, And Qhes Determination.....	12
Appendix E. Study Quality: Risk Of Bias Evaluation.....	27
Appendix F. Data Abstraction Of Included Studies .....	36
Appendix G. List Of On-Going Studies .....	161
Appendix H. Clinical Expert Peer Review .....	171
Appendix I. Sensitivity Analyses For Outcomes From Rcts Evaluating Autologous, Culture-Expanded Stem Cell Therapy For The Treatment Of Knee Oa.....	172

## Appendix Tables & Figures

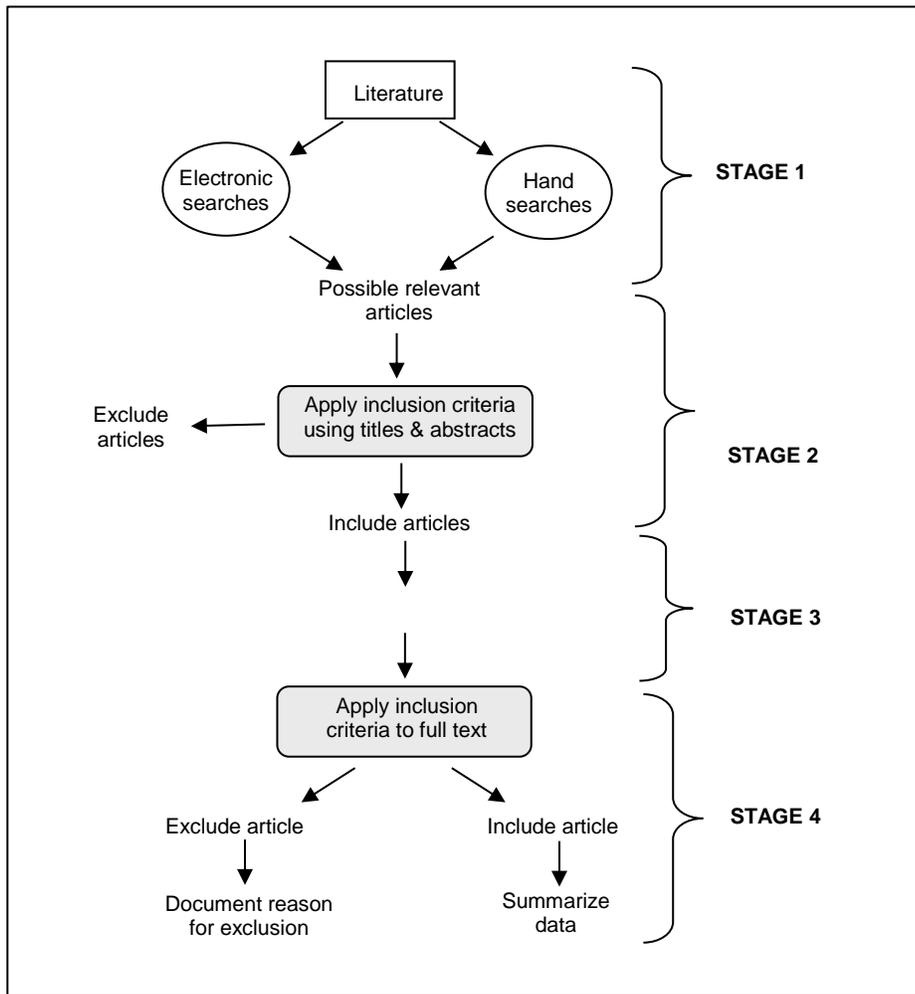

Appendix Table B1: PubMed Search Strategy and Results Performed on 09/12/19 .....	2
Appendix Table B2: EMBASE Search Strategy and Results Performed on 09/12/19 .....	3
Appendix Table C1. List of Excluded Articles .....	4
Appendix Table D1. Definition of the risk of bias categories .....	12
Appendix Table D2. Definitions of the different levels of evidence for studies of therapy.....	13
Appendix Table D3: Assessment of RoB for individual studies of therapy .....	14
Appendix Table D4. Definitions of the different levels of evidence for registry studies of therapy.....	15
Appendix Table D5: Assessment of RoB for individual registry studies .....	15
Appendix Table D6. Definitions of the different levels of evidence for diagnostic test accuracy/validity studies .....	16
Appendix Table D7. Assessment of RoB for individual studies of diagnostic test evaluation..... .....	19
Appendix Table D8. Definitions of the different levels of evidence for reliability studies.....	20
Appendix Table D9. Assessment of risk of bias (RoB) for reliability studies .....	22
Appendix Table D10. Example methodology outline for determining overall strength of evidence (SoE): .. .....	24
Appendix Table D11. Example of methodology for assessing reporting standards for studies of stem cell therapy .....	26
Appendix Table E1. Risk of Bias Assessment: Knee OA trials comparing autologous, <i>non-culture-expanded</i> BM-derived stem cells versus controls* in different patients .....	27

Appendix Table E2. Risk of Bias Assessment: Knee OA trials comparing autologous, <i>non-culture-expanded</i> BM-derived stem cells versus placebo in knees in the same patient. ....	<b>28</b>
Appendix Table E3. Risk of Bias Assessment: Knee OA trials comparing autologous, <i>culture-expanded stem cells</i> versus controls* .....	<b>29</b>
Appendix Table E4. Risk of Bias Assessment: Knee OA trials comparing allogenic, <i>culture-expanded stem cells</i> versus controls* .....	<b>31</b>
Appendix Table E5. Risk of Bias Assessment: Knee OA nonrandomized cohort study evaluating autologous, non-culture-expanded bone marrow-aspirate concentrate stem cells	<b>32</b>
Appendix Table E6. Risk of Bias Assessment: Partial rotator cuff tear cohort comparing autologous, non- <i>culture-expanded stem cells</i> versus PT.....	<b>33</b>
Appendix Table E7. Risk of Bias for RCTs of Intervertebral Disc Repair.....	<b>33</b>
Appendix Table E8. Risk of Bias for RCTs of Tendinopathies.....	<b>34</b>
Appendix Table E9. Methodological quality of registry studies assessing stem cell therapies.....	<b>35</b>
Appendix Table F1: Study characteristics and demographics for comparative studies evaluating the use of stem cell therapies for knee osteoarthritis.....	<b>36</b>
Appendix Table F2: Data abstraction for comparative studies evaluating the use of stem cell therapies for knee osteoarthritis.....	<b>70</b>
Appendix Table F3: Study characteristics, demographics, and data abstraction for case series and treatment registries evaluating the safety of stem cell therapies for knee osteoarthritis.....	<b>94</b>
Appendix Table F4: Study characteristics and demographics for studies evaluating the use of stem cell therapies for hip osteoarthritis .....	<b>113</b>
Appendix Table F5: Data abstraction for studies evaluating the use of stem cell therapies for hip osteoarthritis.....	<b>116</b>
Appendix Table F6: Study characteristics and demographics for studies evaluating the use of stem cell therapies for degenerative disc disease.....	<b>118</b>
Appendix Table F7: Data abstraction for studies evaluating the use of stem cell therapy for degenerative disc disease .....	<b>126</b>
Appendix Table F8: Study characteristics and demographics for studies evaluating the use of stem cell therapies for partial rotator cuff tears .....	<b>133</b>
Appendix Table F9: Data abstraction for studies evaluating the use of stem cell therapies for partial rotator cuff tears .....	<b>135</b>
Appendix Table F10: Study characteristics and demographics for studies evaluating the use of stem cell therapies for Achilles tendinopathy.....	<b>136</b>
Appendix Table F11: Data abstraction for studies evaluating the use of stem cell therapies for Achilles tendinopathy.....	<b>138</b>
Appendix Table F12: Study characteristics and demographics for studies evaluating the use of stem cell therapies for elbow tendinopathy.....	<b>139</b>

Appendix Table F13: Data abstraction for studies evaluating the use of stem cell therapy for elbow tendinopathy.....	<b>140</b>
Appendix Table F14: Study characteristics and demographics for studies evaluating the use of stem cell therapies for ACL tears .....	<b>141</b>
Appendix Table F15: Data abstraction for studies evaluating the use of stem cell therapies for ACL tears . .....	<b>143</b>
Appendix Table F16: Study characteristics and demographics for studies evaluating the use of stem cell therapies in patients with various orthopedic conditions (safety & effectiveness data) .....	<b>144</b>
Appendix Table F17: Data abstraction for studies evaluating the use of stem cell therapies in patients with various orthopedic conditions (safety & effectiveness data).....	<b>149</b>
Appendix Table F18: Study characteristics, demographics, and data abstraction for studies evaluating the use of stem cell therapies in patients with various orthopedic conditions (safety only).....	<b>152</b>
Appendix Table F19. Non-treatment related AEs reported by across case series assessing cultured/ expanded cells in patients with knee OA .....	<b>160</b>
Appendix Table G1. Current trials of stem cell therapy in the USA .....	<b>161</b>
Appendix Table G2. Current trials of stem cell therapy in countries outside of the USA.....	<b>165</b>
Appendix Figure I1. Autologous, culture-expanded stem cells for knee OA – sensitivity analysis of the WOMAC total follow-up scores from RCTs excluding Lamo-Espinosa 2016/2018. .	<b>172</b>
Appendix Figure I2. Autologous, culture-expanded stem cells for knee OA – sensitivity analysis of the WOMAC physical function follow-up scores from RCTs excluding Lamo-Espinosa 2016/2018. ....	<b>173</b>
Appendix Figure I3. Autologous, culture-expanded stem cells for knee OA – sensitivity analysis of the WOMAC stiffness follow-up scores from RCTs excluding Lamo-Espinosa 2016/2018. .....	<b>174</b>
Appendix Figure I4. Autologous, cultured-expanded stem cells for knee OA – sensitivity analysis of the WOMAC pain follow-up scores from RCTs excluding Lamo-Espinosa 2016/2018...	<b>175</b>

### APPENDIX A. Algorithm for Article Selection

## APPENDIX B. Search Strategies

Below is the search strategy for PubMed. Parallel strategies were used to search other electronic databases listed below. Keyword searches were conducted in the other listed resources. In addition, hand-searching of included studies was performed.

**Appendix Table B1: PubMed Search Strategy and Results Performed on 09/12/19**

	Search Strategy	No. of hits
1.	"Stem Cells"[Mesh] OR "Stem Cell Transplantation"[Mesh] OR "Stem Cell Research"[Mesh] OR "Bone Marrow Transplantation"[Mesh] OR "stem cell*" [TIAB] OR progenitor cell* [TIAB] OR stromal cell* [TIAB] OR mesenchymal cell* [TIAB] OR bone marrow [TIAB] OR osteocel [TIAB]	518,139

## APPENDIX C. Excluded Articles

Articles excluded as primary studies after full text review, with reason for exclusion.

**Appendix Table C1. List of Excluded Articles**

	Citation	Reason for exclusion after full-text review
1.	Aghdami N, Liastani MG, Emadedin M, et al. Repeated intra articular injection of bone marrow derived mesenchymal stem cell in knee osteoarthritis: double blind randomized clinical trial. <i>Cytotherapy</i> 2014;16:S14.	Abstract only; does not appear that it has been published as a full length article
2.	Bain B. Bone marrow biopsy morbidity and mortality: 2002 data. <i>Clinical &amp; Laboratory Haematology</i> 2004;26:315-8.	Safety specific to bone marrow biopsy
3.	Bain B. Bone marrow biopsy morbidity: review of 2003. <i>Journal of clinical pathology</i> 2005;58:406-8.	Safety specific to bone marrow biopsy
4.	Bain BJ. Bone marrow biopsy morbidity and mortality. <i>British journal of haematology</i> 2003;121:949-51.	Safety specific to bone marrow biopsy
5.	Bastos R, Mathias M, Andrade R, et al. Intra-articular injections of expanded mesenchymal stem cells with and without addition of platelet-rich plasma are safe and effective for knee osteoarthritis. <i>Knee surgery, sports traumatology, arthroscopy : official journal of the ESSKA</i> 2018;26:3342-50.	Comparative study of the addition of PRP with <10 patients per treatment group
6.	Bucher TA, Ebert JR, Smith A, Bredahl W, Fallon M, Wang T, Zheng MH, Janes GC. Autologous tenocyte injection for the treatment of chronic recalcitrant gluteal tendinopathy: a prospective pilot study. <i>Orthopaedic journal of sports medicine</i> . 2017 Feb 21;5(2):2325967116688866.	Excluded intervention; Tenocytes are further differentiated than stem cells
7.	Buda R, Vannini F, Castagnini F, et al. Regenerative treatment in osteochondral lesions of the talus: autologous chondrocyte implantation versus one-step bone marrow derived cells transplantation. <i>International orthopaedics</i> 2015;39:893-900.	Excluded intervention; stem cells as an adjunct to surgery
8.	Centeno C, Markle J, Dodson E, et al. Treatment of lumbar degenerative disc disease-associated radicular pain with culture-expanded autologous mesenchymal stem cells: a pilot study on safety and efficacy. <i>Journal of translational medicine</i> 2017;15:197.	Excluded population; patients with radicular low back pain
9.	Centeno CJ, Al-Sayegh H, Bashir J, Goodyear S, Freeman MD. A dose response analysis of a specific bone marrow concentrate treatment protocol for knee osteoarthritis. <i>BMC musculoskeletal disorders</i> 2015;16:258.	Meets all criteria for inclusion of safety data only, but does not report any safety data.
10.	Centeno CJ, Busse D, Kisiday J, Keohan C, Freeman M, Karli D. Increased knee cartilage volume in degenerative joint disease using percutaneously implanted, autologous mesenchymal stem cells. <i>Pain physician</i> 2008;11:343-53.	Case report (n=1)
11.	Centeno CJ, Freeman MD. Percutaneous injection of autologous, culture-expanded mesenchymal stem cells into carpometacarpal hand joints: a case series with an untreated comparison group. <i>Wiener medizinische Wochenschrift (1946)</i> 2014;164:83-7.	<10 patients per treatment arm (6 vs. 4)
12.	Centeno CJ, Pitts J, Al-Sayegh H, Freeman MD. Anterior cruciate ligament tears treated with percutaneous injection of autologous	The 10 patients reported on in this study are included in larger registry

	Citation	Reason for exclusion after full-text review
	bone marrow nucleated cells: a case series. <i>Journal of pain research</i> 2015;8:437.	study that has been included in the evidence base
13.	Centeno CJ, Schultz JR, Cheever M, et al. Safety and complications reporting update on the re-implantation of culture-expanded mesenchymal stem cells using autologous platelet lysate technique. <i>Current stem cell research &amp; therapy</i> 2011;6:368-78.	Data from patients included in this study are included as part of a larger registry study published subsequent to this publication.
14.	Centeno CJ, Schultz JR, Cheever M, Robinson B, Freeman M, Marasco W. Safety and complications reporting on the re-implantation of culture-expanded mesenchymal stem cells using autologous platelet lysate technique. <i>Current stem cell research &amp; therapy</i> 2010;5:81-93.	Data from patients included in this study are included as part of a larger registry study published subsequent to this publication.
15.	Chahal J, Gómez-Aristizábal A, Shestopaloff K, et al. Bone Marrow Mesenchymal Stromal Cells in Patients with Osteoarthritis Results in Overall Improvement in Pain and Symptoms and Reduces Synovial Inflammation. <i>Stem cells translational medicine</i> 2019.	Dose escalation study with <10 patients per treatment group (n=4 in each group; 1X10 <sup>6</sup> , 10X10 <sup>6</sup> , 50X10 <sup>6</sup> )
16.	Clar C, Cummins E, McIntyre L, et al. Clinical and cost-effectiveness of autologous chondrocyte implantation for cartilage defects in knee joints: Systematic review and economic evaluation. <i>Health Technology Assessment</i> 2005;9:iii-48.	Excluded intervention; stem cells as an adjunct to surgery
17.	Clarke AW, Alyas F, Morris T, Robertson CJ, Bell J, Connell DA. Skin-derived tenocyte-like cells for the treatment of patellar tendinopathy. <i>The American journal of sports medicine</i> 2011;39:614-23.	Excluded intervention; Tenocytes are further differentiated than stem cells
18.	Connell, David, et al. "Treatment of lateral epicondylitis using skin-derived tenocyte-like cells." <i>British journal of sports medicine</i> 43.4 (2009): 293-298.	Excluded intervention; Tenocytes are further differentiated than stem cells
19.	Coric D, Pettine K, Sumich A, Boltes MO. Prospective study of disc repair with allogeneic chondrocytes presented at the 2012 Joint Spine Section Meeting. <i>Journal of Neurosurgery: Spine</i> . 2013 Jan 1;18(1):85-95.	Excluded intervention; Chondrocytes are further differentiated than stem cells
20.	Cruz-Sánchez PM, Gámez-Pérez A, Rodríguez-Orta CdIA, et al. Impacto del tratamiento con células madre adultas en la osteoartrosis de la rodilla. <i>Revista Cubana de Hematología, Inmunología y Hemoterapia</i> 2013;29:272-83.	Study published only in Spanish
21.	Darrow M, Shaw B, Schmidt N, Boeger G, Budgett S. Treatment of shoulder osteoarthritis and rotator cuff tears with bone marrow concentrate and whole bone marrow injections. <i>Cogent Medicine</i> 2019;6.	Study comparing different cell preparations; would be included for safety only, but study does not report any safety data
22.	de Windt TS, Vonk LA, Slaper-Cortenbach IC, et al. Allogeneic mesenchymal stem cells stimulate cartilage regeneration and are safe for single-stage cartilage repair in humans upon mixture with recycled autologous chondrons. <i>Stem cells (Dayton, Ohio)</i> 2017;35:256-64.	Excluded intervention; stem cells as an adjunct to surgery
23.	de Windt TS, Vonk LA, Slaper-Cortenbach ICM, Nizak R, van Rijen MHP, Saris DBF. Allogeneic MSCs and Recycled Autologous Chondrons Mixed in a One-Stage Cartilage Cell Transplantation: A First-in-Man Trial in 35 Patients. <i>Stem cells (Dayton, Ohio)</i> 2017;35:1984-93.	Excluded intervention; stem cells as an adjunct to surgery

	Citation	Reason for exclusion after full-text review
24.	Elabd C, Centeno CJ, Schultz JR, Lutz G, Ichim T, Silva FJ. Intra-discal injection of autologous, hypoxic cultured bone marrow-derived mesenchymal stem cells in five patients with chronic lower back pain: a long-term safety and feasibility study. <i>Journal of translational medicine</i> 2016;14:253.	Case series with less than 10 patients (N=5)
25.	Emadedin M, Ghorbani Liastani M, Fazeli R, et al. Long-Term Follow-up of Intra-articular Injection of Autologous Mesenchymal Stem Cells in Patients with Knee, Ankle, or Hip Osteoarthritis. <i>Archives of Iranian medicine</i> 2015;18:336-44.	Reported separately; knee (n=6), ankle (n=6), hip (n=5); would not meet n cut-off for case series; however, long term follow-up = 30 months
26.	Freitag J, Ford J, Bates D, et al. Adipose derived mesenchymal stem cell therapy in the treatment of isolated knee chondral lesions: design of a randomised controlled pilot study comparing arthroscopic microfracture versus arthroscopic microfracture combined with postoperative mesenchymal stem cell injections. <i>BMJ open</i> 2015;5:e009332.	Study protocol; would otherwise be excluded as this study assesses stem cells as an adjunct to surgery
27.	Gellhorn, Alfred C., and Alex Han. "The use of dehydrated human amnion/chorion membrane allograft injection for the treatment of tendinopathy or arthritis: a case series involving 40 patients." <i>PM&amp;R</i> 9.12 (2017): 1236-1243.	Excluded intervention; Tenocytes are further differentiated than stem cells
28.	Giannini S, Buda R, Vannini F, Cavallo M, Grigolo B. One-step bone marrow-derived cell transplantation in talar osteochondral lesions. <i>Clin Orthop Relat Res</i> 2009;467:3307-20.	Excluded intervention; stem cells as an adjunct to surgery
29.	Gobbi A, Chaurasia S, Karnatzikos G, Nakamura N. Matrix-Induced Autologous Chondrocyte Implantation versus Multipotent Stem Cells for the Treatment of Large Patellofemoral Chondral Lesions: A Nonrandomized Prospective Trial. <i>Cartilage</i> 2015;6:82-97.	Excluded intervention; stem cells as an adjunct to surgery
30.	Gupta PK, Chullikana A, Rengasamy M, et al. Efficacy and safety of adult human bone marrow-derived, cultured, pooled, allogeneic mesenchymal stromal cells (Stempeucel®): preclinical and clinical trial in osteoarthritis of the knee joint. <i>Arthritis research &amp; therapy</i> 2016;18:301.	Excluded setting; patients hospitalized for the procedure
31.	Hanselman AE, Tidwell JE, Santrock RD. Cryopreserved human amniotic membrane injection for plantar fasciitis: a randomized, controlled, double-blind pilot study. <i>Foot &amp; ankle international</i> 2015;36:151-8.	<10 patients per treatment arm
32.	Hernigou P, Dubory A, Homma Y, Flouzat Lachaniette CH, Chevallier N, Rouard H. Single-stage treatment of infected tibial non-unions and osteomyelitis with bone marrow granulocytes precursors protecting bone graft. <i>International Orthopaedics</i> 2018;42:2443-50. 8	Unclear setting; stem cells as adjunct to surgery
33.	Hernigou P, Homma Y, Flouzat-Lachaniette CH, Poignard A, Chevallier N, Rouard H. Cancer risk is not increased in patients treated for orthopaedic diseases with autologous bone marrow cell concentrate. <i>Journal of Bone and Joint Surgery - Series A</i> 2013;95:2215-21.	Safety specific study; % with each orthopedic condition is unclear - many not conditions not includable

## APPENDIX D. Risk of Bias, Class of Evidence, Strength of Evidence, and QHES Determination

Each included comparative study is rated against pre-set criteria that resulted in a Risk of Bias (RoB) assessment and presented in a table. Definitions of the RoB categories are provided in Table D1, and criteria for determining RoB for primary studies of therapy are listed in the Table D2. Table D3 provides an example of the format used to assess RoB for individual cohort studies of therapy. A “No” indicates that the criterion was not met; an “Unclear” indicates that the criterion could not be determined with the information provided or was not reported by the author. Risk of bias assessments were not conducted for case series; all were considered High risk of bias.

**Appendix Table D1. Definition of the risk of bias categories**

<b>Risk of Bias</b>	<b>Definition</b>
<b>Low risk of bias</b>	Study adheres to commonly held tenets of high quality design, execution and avoidance of bias
<b>Moderately low risk of bias</b>	Study has potential for some bias; does not meet all criteria for low risk of bias but deficiencies not likely to invalidate results or introduce significant bias
<b>Moderately high risk of bias</b>	Study has flaws in design and/or execution that increase potential for bias that may invalidate study results
<b>High risk of bias</b>	Study has significant potential for bias; does not include design features geared toward minimizing bias and/or does not have a comparison group

**Appendix Table D2. Definitions of the different levels of evidence for studies of therapy**

Risk of Bias	Studies of Therapy*	
	Study design	Criteria*
<b>Low risk:</b> Study adheres to commonly held tenets of high quality design, execution and avoidance of bias	Good quality RCT	<ul style="list-style-type: none"> <li>• Random sequence generation</li> <li>• Statement of allocation concealment</li> <li>• Intent-to-treat analysis</li> <li>• Blind or independent assessment for primary outcome(s)</li> <li>• F/U rate of 80%+</li> <li>• &lt;10% difference in F/U between groups</li> <li>• Controlling for possible confounding‡</li> </ul>
<b>Moderately low risk:</b> Study has potential for some bias; study does not meet all criteria for class I, but deficiencies not likely to invalidate results or introduce significant bias	Moderate quality RCT	<ul style="list-style-type: none"> <li>• Violation of one or two of the criteria for good quality RCT</li> </ul>
	Good quality cohort	<ul style="list-style-type: none"> <li>• Blind or independent assessment for primary outcome(s)</li> <li>• F/U rate of 80%+</li> <li>• &lt;10% difference in F/U between groups</li> <li>• Controlling for possible confounding‡</li> </ul>
<b>Moderately High risk:</b> Study has significant flaws in design and/or execution that increase potential for bias that may invalidate study results	Poor quality RCT	<ul style="list-style-type: none"> <li>• Violation of three or more of the criteria for good quality RCT</li> </ul>
	Moderate quality cohort	<ul style="list-style-type: none"> <li>• Violation of any of the criteria for good quality cohort</li> </ul>
	Case-control	<ul style="list-style-type: none"> <li>• Any case-control design</li> </ul>
<b>High risk:</b> Study has significant potential for bias; lack of comparison group precludes direct assessment of important outcomes	Poor quality cohort	<ul style="list-style-type: none"> <li>• Violation of two or more criteria for a good quality cohort</li> <li>• Any case series design</li> </ul>
	Case series	

\* Additional domains evaluated in studies performing a formal test of interaction for subgroup modification (i.e., HTE) based on recommendations from Oxman and Guyatt<sup>3,4,7</sup>:

- Is the subgroup variable a characteristic specified at baseline or after randomization? (subgroup hypotheses should be developed a priori)
- Did the hypothesis precede rather than follow the analysis and include a hypothesized direction that was subsequently confirmed?
- Was the subgroup hypothesis one of a smaller number tested?

† Outcome assessment is independent of healthcare personnel judgment. Reliable data are data such as mortality or re-operation.

‡ Authors must provide a description of robust baseline characteristics, and control for those that are unequally distributed between treatment groups.

**Appendix Table D3: Assessment of RoB for individual studies of therapy**

Methodological Principle	Author 1, 2014	Author 2, 2012	Author 3, 2010
<b>Study design</b>			
Randomized controlled trial	■	■	■
Prospective cohort study			
Retrospective cohort study			
Case-control			
Case-series			
Random sequence generation*	Yes	No	Yes
Concealed allocation*	Unclear†	No	Yes
Intention to treat*	Yes	Yes	Yes
Independent or blind assessment	No§	Yes	Yes
Complete follow-up of ≥80%	Yes**	Yes	Yes
<10% difference in follow-up between groups	Yes	No	Yes
Controlling for possible confounding†	Yes	Yes	Yes
<b>Risk of Bias</b>	Moderately Low	Moderately High	Low

\*Applies to randomized controlled trials only.

†Authors must provide a description of robust baseline characteristics, and control for those that are unequally distributed between treatment groups.

‡Authors state that allocation occurred via envelopes prepared by a study coordinator; however, they did not specify that the envelopes were opaque so the study did not receive credit for this criterion.

§An independent critical events committee adjudicated all clinical end points in a blinded fashion for the initial two thirds of events. However, there was a delay in adjudicating the final one third of events which were adjudicated without blinding.

\*\*For primary outcome at 12 months (end of study) 89% follow-up, criterion met; for primary outcome at additional 24 months follow up was 73%, criterion not met for 24 months.

### Procedures for determining adherence to Risk of Bias for Registry Studies

Table D4 describes Aggregate Analytics' methodology for determining whether or not a registry study has met the specific individual criterion used to assign the risk of bias. Table D5 provides an example of the format used to assess RoB for individual registry studies of treatment. A "No" indicates that the criterion was not met; an "Unclear" indicates that the criterion could not be determined with the information provided or was not reported by the author.

**Appendix Table D4. Definitions of the different levels of evidence for registry studies of therapy**

Risk of Bias	Study design	Criteria
<b>Moderately low risk:</b> Study has potential for some bias; does not meet all criteria for class I but deficiencies not likely to invalidate results or introduce significant bias	Good quality registry study/cohort study	<ul style="list-style-type: none"> <li>• Designed specifically for conditions evaluated</li> <li>• Includes prospective data only</li> <li>• Validation of completeness and quality of data</li> <li>• Patients followed long enough for outcomes to occur</li> <li>• Independent outcome assessment*</li> <li>• Complete follow-up of <math>\geq 80\%</math></li> <li>• Controlling for possible confounding<sup>†</sup></li> <li>• Accounting for time at risk<sup>‡</sup></li> </ul>
<b>Moderately high risk:</b> Study has flaws in design and/or execution that increase potential for bias that may invalidate study results	Moderate quality registry study/cohort	<ul style="list-style-type: none"> <li>• Prospective data from registry designed specifically for conditions evaluated with violation of 2 of the rest of the criteria in level II</li> </ul>
<b>High risk:</b> Study has significant potential for bias; does not include design features geared toward minimizing bias and/or does not have a comparison group	Poor quality registry study/cohort	<ul style="list-style-type: none"> <li>• Prospective data from registry designed specifically for conditions evaluated with violation of 3 or more of the rest of the criteria in level II</li> <li>• Retrospective data or data from a registry not designed specifically for conditions evaluated</li> </ul>

**Appendix Table D5: Assessment of RoB for individual registry studies**

Methodological principle	Australia Registry	Swedish Registry	UK Registry
Designed specifically for conditions evaluated	Yes	Yes	No
Includes prospective data only	Yes	Yes	Unclear
Validation of completeness and quality of data	Yes	No	No
Patients followed long enough for outcomes to occur	Yes	Yes	Yes
Independent outcome assessment*	Yes	Yes	Yes
Complete follow-up of $\geq 80\%$	Yes	No	No
Controlling for possible confounding <sup>†</sup>	Yes	Yes	No
Accounting for time at risk <sup>‡</sup>	Yes	Yes	Yes
<b>Risk of Bias</b>	<b>Mod Low</b>	<b>Mod High</b>	<b>High</b>

\* Outcome assessment is independent of healthcare personnel judgment. Some examples include patient reported outcomes, death, and reoperation.

<sup>†</sup> Authors must provide a description of robust baseline characteristics, and control for those that are unequally distributed between treatment groups.

<sup>‡</sup> Equal follow-up times or for unequal follow-up times, accounting for time at risk.

### Risk of Bias for Diagnostic Test Studies – Accuracy/Validity Studies

Table D6 and Figure D1 outline Aggregate Analytics' methodology for evaluating the quality of evidence for diagnostic studies of accuracy/validity and criteria used to determine the Risk of Bias (RoB). The

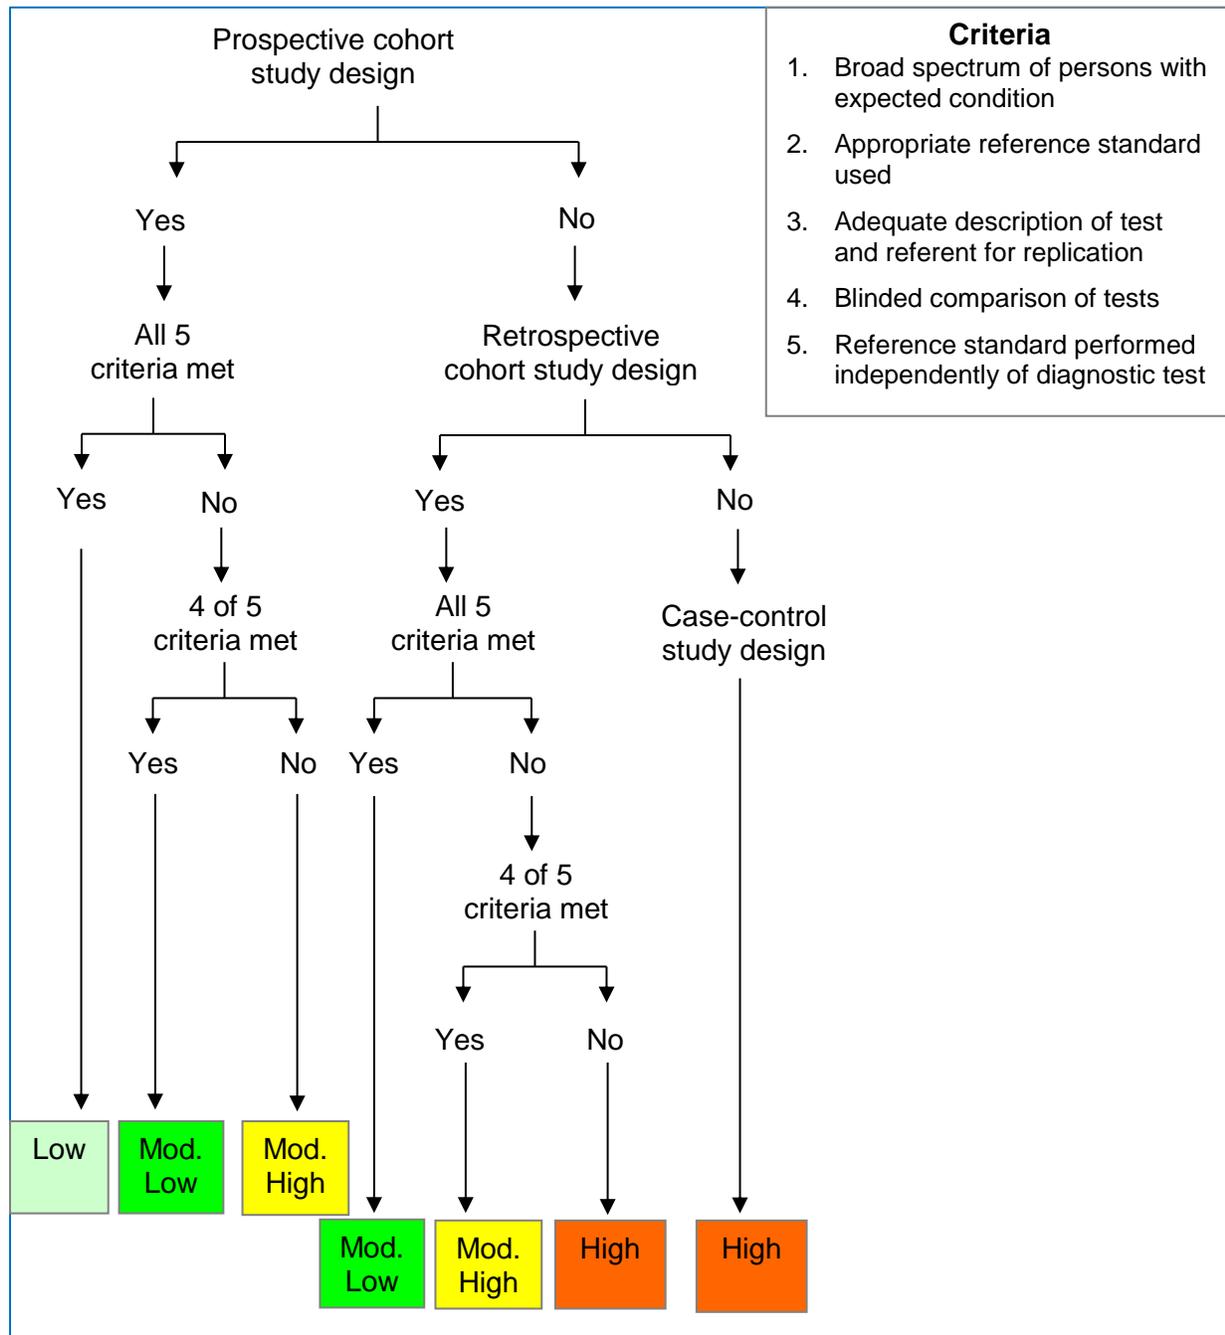

procedure that follows describes specific considerations used to determine whether or not the various criteria were met. This method takes into account the primary sources of bias for such studies.

Each included study was evaluated independently by two investigators based on the criteria below and a RoB assigned to each article, initially at the abstract level and confirmed when the full articles were reviewed. Discrepancies in RoB determination were resolved by discussion until consensus was achieved. Table D7 provides an example of the format used to assess RoB for individual studies of diagnostic test evaluation.

**Appendix Table D6. Definitions of the different levels of evidence for diagnostic test accuracy/validity studies**

RoB	Study type	Criteria
Low	Good quality prospective study	Broad spectrum of persons with the expected condition Appropriate reference standard used Adequate description of test and reference for replication Blinded comparison of tests with appropriate reference standard Reference standard performed independently of diagnostic test
Moderately Low	Moderate quality prospective study	Violation of any one of the criteria for a good quality prospective study
	Good quality retrospective study	Broad spectrum of persons with the expected condition Appropriate reference standard used Adequate description of test and reference for replication Blinded comparison of tests with appropriate reference standard Reference standard performed independently of diagnostic test
Moderately High	Poor quality prospective study	Violation of any two or more of the criteria for a good quality prospective study
	Moderate quality retrospective study	Violation of any one of the criteria for a good quality retrospective study
High	Poor quality retrospective study	Violation of any two or more of the criteria for a good quality retrospective study
	Case-Control Study	

**Figure D1. Level of Evidence Algorithm – Accuracy/Validity Studies**

**Procedures for determining adherence to Risk of Bias criteria for Diagnostic Test Studies – Accuracy/Validity Studies**

The following describes the method for determining whether or not a given study has met the specific individual criterion used to assign the RoB. Table D6 provides a template for indicating whether the individual criterion is met or not. A “No” indicates that the criterion was not met; an “Unclear” indicates that the criterion could not be determined with the information provided or was not reported by the author.

Determine if the study is **prospective or retrospective**.

Accuracy of diagnostic tests is best assessed using a prospective study of consecutive series of patients from a relevant patient population (i.e. study designed for prospective collection of data using specific protocols). Ideally, a consecutive series of patients or random selection from the relevant patient population should be prospectively studied. Retrospective collection of data or evaluation of patients who have had the diagnostic test and reference test previously may be more subject to bias.

If it cannot be determined whether a prospective or retrospective approach was taken, no credit will be given for this criterion having been met.

Was a **broad spectrum of persons with the suspected condition** used to evaluate the diagnostic test and reference standard?

The study population must be comprised of those with a broad spectrum of suspected disease who are likely to have the test now or in the future. A broad spectrum would include patients with mild as well as more severe cases, those presenting early as well as late and those whose differential diagnosis may be commonly confused with the condition of interest. Subjects from specialty referral sources may be more likely to have a specific abnormality/condition than those presenting to a general family practice clinic. Overestimation of diagnostic accuracy may occur if a population with known disease is compared with a group of normal individuals instead of those from the relevant patient population.

Studies providing a description of the demographic and clinical characteristics of subjects were given credit as appropriate for the type of disease under investigation.

Was an **appropriate reference standard** used to compare the diagnostic test being evaluated?

Ideal reference standards are termed “gold” standards and in theory, provide the “truth” about the presence or absence of a condition or disease. Such standards provide a basis for comparing the accuracy of other tests and allow for the calculation of characteristics such as sensitivity, specificity and predictive values.

In most instances, the reference standard does not perfectly classify individuals with respect to the presence or absence of disease, but may reflect the current “best” reference and/or one that can be practically applied. It should be “likely” to classify patients according to disease status. A reference measure can be performed at the time of the testing. It may be an anatomical, physiological or pathological state or measure or a specific outcome at a later date.

The reference standard should be reproducible and the description of both the referent standard and the test should be explicit enough for replication, validation and generalization.

**Are the details of the test and the reference/gold standard sufficient to allow study replication?**

Are the technical features of the test and protocols used to collect information about test results, any measurements performed, planes of section evaluated, diagnostic criteria used, etc. sufficient that other investigators could duplicate the conditions and reproduce the findings in a similar population?

**Was there blinded comparison of the tests with the appropriate reference standard?**

Interpretation of the reference standard must be done without prior knowledge of the test results and the test must be interpreted without knowledge of the results of the reference test. This is necessary to avoid bias. It must be clear from the text that tests were interpreted without knowledge of the results of the other. A statement that blinding was done (for either test, preferably both) was necessary for credit.

**Was the reference standard performed independently of the diagnostic test?**

The reference standard must have been applied objectively or blindly to all patients without the results of test influencing use of the reference. If the “test” affects the reference (or referral to the reference test) or is part of the reference standard, this does not constitute independent performance of the test.

**Appendix Table D7. Assessment of RoB for individual studies of diagnostic test evaluation**

METHODOLOGICAL PRINCIPLE	Author 1 (1999)	Author 2 (2002)	Author 3 (2004)	Author 4 (2005)
<b>Study Design</b>				
Prospective cohort design			■	
Retrospective cohort design	■	■		■
Case-control design				
Broad spectrum of patients with expected condition	Yes	Yes	Unclear	Yes
Appropriate reference standard used	Yes	Yes	No	No
Adequate description of test and reference for replication	Unclear	No	No	No
Blinded comparison with appropriate reference	Yes	No	Yes	No
Reference standard performed independently of test	Yes	Yes	Yes	Yes
<b>Risk of Bias</b>	<b>Mod. Low</b>	<b>Mod. High</b>	<b>Mod. High</b>	<b>High</b>

\* “No” indicates that the criterion was not met; “Unclear” indicates that the criterion could not be determined with the information provided or was not reported by the author.

### Risk of Bias for Diagnostic Test Studies – Reliability Studies

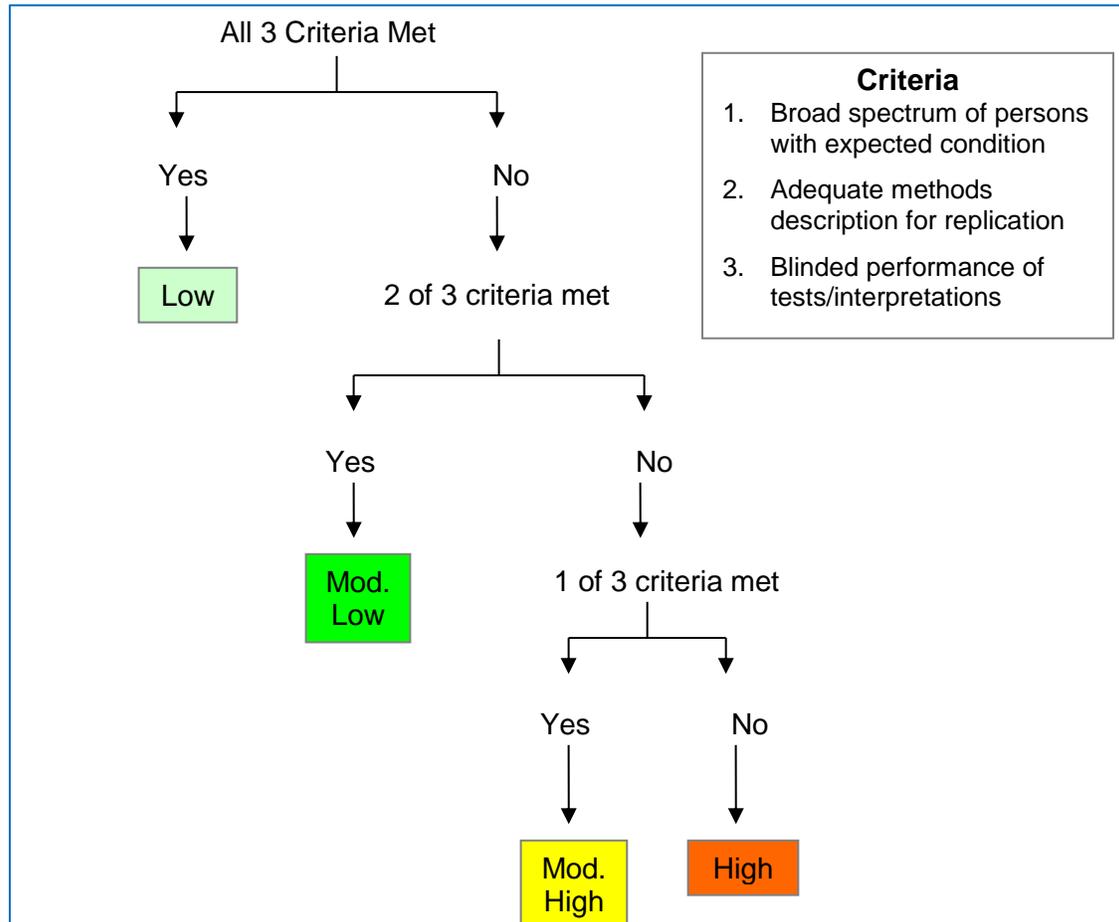

Methods for assessing the quality of evidence for reliability studies have not been well reported in the literature. Aggregate Analytics’ determination of quality for such is based on epidemiologic methods for evaluating validity and reliability.

Table D8 and Figure D2 describe the method for determining whether or not a given study has met the specific individual criterion used to assign the Risk of Bias (RoB). Table D9 provides a template for indicating whether the individual criterion is met or not. A “No” indicates that the criterion was not met; an “Unclear” indicates that the criterion could not be determined with the information provided or was not reported by the author.

**Appendix Table D8. Definitions of the different levels of evidence for reliability studies**

RoB	Study type	Criteria
Low	Good quality study	Broad spectrum of persons with the expected condition Adequate description of methods for replication Blinded performance of tests, measurements or interpretation Second test/interpretation performed independently of the first
Moderately Low	Moderate quality	Violation of any one of the criteria for a good quality study
Moderately High	Poor quality study	Violation of any two of the criteria
High	Very poor quality study	Violation of all three of the criteria

Figure D2. Level of Evidence Algorithm – Reliability studies

### Procedures for determining adherence to Risk of Bias criteria for Reliability studies

For these studies, the first performance or interpretation of the text is usually considered the “reference” and the second performance or interpretation the “test”. Typical reliability studies are done using the same method (e.g., supine MRI) and include test-retest, inter- and intra-rater reliability. Statistical analysis is based on whether the same method or different methods are compared, the types of variables measured and the goal of the study. In general, the degree (%) of concordance does not account for the role of chance agreement and is not a good index of reliability.<sup>7</sup> Different types of *kappa* ( $\kappa$ ) or statistical correlation are frequently used to evaluate the role of chance.

Determination of the RoB involves evaluation of the following questions:

Was a **broad spectrum of persons with the suspected condition** used to determine reliability?

The study population must be comprised of those with a broad spectrum of suspected disease who are likely to have the test now or in the future. Since differences in gender, age, body habitus and other characteristics may influence measurements and the ability to reproduce the results, the range of patients used for reliability studies is important. Ideally a random sample of patients from the relevant clinical population would be used but may not be feasible, depending on the study. A broad spectrum would include patients with mild as well as more severe cases, those presenting early as well as late and

those whose differential diagnosis may be commonly confused with the condition of interest. Reproducibility studies in a population with known disease may give different results compared with studies on a group of normal individuals and may not give an accurate picture of overall reproducibility. (If the goal of the study is to evaluate the potential for differential measurement error or bias, the separate analyses on “normal” and “diseased” populations should be done to evaluate the extent of such bias. If it is a test-retest design, the test administrations should be on the same population. If it is an inter- or inter-rater reliability study the object (e.g., radiographs) should be the same for each reading/interpretation, (e.g., the same patients’ radiographs are read twice).

**Are the details of the methods sufficient to allow study replication?**

Is the description of the methods, i.e. the protocols used to collect information, measurements taken, planes of section, diagnostic criteria used, etc. sufficient that other investigators could duplicate the conditions and reproduce the findings in a similar population? Are the methods used for each part of the replication consistent?

**Was there blinded/independent performance of the repeat test administrations or interpretations?**

The second administration of the test or second interpretation of results should be done without influence of the first test/interpretation. This is necessary to avoid bias. It must be clear from the text that both tests were interpreted without knowledge of the results of the other. Examples of when the administration would not be considered blinded or independent could include:

Interpretation of the second test is to be done without prior knowledge of the test results or the first interpretation.

The timing of the second test administration or reading/interpretation of the results is not done such that sufficient time has elapsed between them to avoid influence of the first test/interpretation on the results of the second. In the case of re-administration of the test, the timing should not be so far apart that the stage/period of disease is different from the first administration.

**Appendix Table D9. Assessment of risk of bias (RoB) for reliability studies**

METHODOLOGICAL PRINCIPLE	Author 1 (1999)	Author 2 (2002)	Author 3 (2004)	Author 4 (2005)
Broad spectrum of patients with expected condition	Yes	Yes	Unclear	No
Adequate description of methods for replication	Yes	Yes	No	No
Blinded/independent comparison of tests/interpretations	Yes	No	Yes	Unclear
<b>Risk of Bias</b>	<b>Low</b>	<b>Mod. Low</b>	<b>Mod. High</b>	<b>High</b>

**Determination of Overall Strength (Quality) of Evidence**

The strength of evidence for the overall body of evidence for all *critical health outcomes* was assessed by one researcher following the principles for adapting GRADE (Grades of Recommendation Assessment, Development and Evaluation) as outlined by the Agency for Healthcare Research and Quality (AHRQ)<sup>1,6,8</sup>.

The strength of evidence was based on the highest quality evidence available for a given *primary* outcome. In determining the strength of body of evidence regarding a given *primary* outcome, the following domains were considered:

- **Risk of bias:** the extent to which the included studies have protection against bias.
- **Consistency:** the degree to which the included studies report results are similar in terms of range and variability.
- **Directness:** describes whether the evidence is directly related to patient health outcomes.
- **Precision:** describes the level of certainty surrounding the effect estimates.
- **Publication bias:** is considered when there is concern of selective publishing.

All AHRQ “required” and “additional” domains (risk of bias, consistency, directness, precision, and if possible, publication bias) were assessed. Bodies of evidence consisting of RCTs were initially considered as High strength of evidence (SoE), while those that comprised nonrandomized studies began as Low strength of evidence. The strength of evidence could be downgraded based on the limitations described above. There could also be situations where the *nonrandomized* studies could be upgraded, including the presence of plausible unmeasured confounding and bias that would decrease an observed effect or increase an effect if none was observed, presence of a dose-response relationship, and large magnitude of effect (strength of association) *if no downgrades for domains above*. Publication and reporting bias are difficult to assess. Publication bias is particularly difficult to assess with fewer than 10 RCTs (AHRQ methods guide). When publication bias was unknown in all studies and this domain is often eliminated from the strength of evidence tables for our reports. The final strength of evidence for each **primary** outcome was assigned an overall grade of high, moderate, low, or insufficient, which are defined as follows:

**High**— Very confident that effect size estimates lie close to the true effect for this outcome; there are few or no deficiencies in the body of evidence; we believe the findings are stable.

**Moderate**— Moderately confident that effect size estimates lie close to the true effect for this outcome; some deficiencies in the body of evidence; we believe the findings are probably stable but some doubt remains.

**Low**— Limited confidence that effect size estimates lie close to the true effect for this outcome; important or numerous deficiencies in the body of evidence; we believe that additional evidence is needed before concluding that findings are stable or that the estimate is close to the true effect.

**Insufficient**— We have no evidence, are unable to estimate an effect or have no confidence in the effect estimate for this outcome; OR no available evidence or the body of evidence has unacceptable deficiencies precluding judgment.

Similar methods for determining the overall quality (strength) of evidence related to economic studies have not been reported, thus the overall strength of evidence for outcomes reported in Key Question 4 was not assessed.

**Appendix Table D10. Example methodology outline for determining overall strength of evidence (SoE):**

All AHRQ “required” and “additional” domains\* are assessed. Only those that influence the baseline grade are listed in table below.

Baseline strength: HIGH = RCTs. LOW = observational, cohort studies, administrative data studies.

DOWNGRADE: Risk of bias for the individual article evaluations (1 or 2); Inconsistency\*\* of results (1 or 2); Indirectness of evidence (1 or 2); Imprecision of effect estimates (1 or 2); Sub-group analyses not stated *a priori* and no test for interaction (2)

UPGRADE (non-randomized studies): Large magnitude of effect (1 or 2); Dose response gradient (1) done for observational studies ***if no downgrade for domains above***

Outcome	Strength of Evidence	Conclusions & Comments	Baseline SOE	DOWNGRADE	UPGRADE
Outcome	<b>HIGH</b>	Summary of findings	<b>HIGH</b> RCTs	<b>NO</b> consistent, direct, and precise estimates	<b>NO</b>
Outcome	<b>MODERATE</b>	Summary of findings	<b>LOW</b> Cohort studies	<b>NO</b> consistent, direct, and precise estimates; high quality (moderately low ROB)	<b>YES</b> Large effect
Outcome	<b>LOW</b>	Summary of findings	<b>HIGH</b> RCTs	<b>YES (2)</b> Inconsistent Indirect	<b>NO</b>

\*Required domains: risk of bias, consistency, directness, precision. Plausible confounding that would decrease observed effect is accounted for in our baseline risk of bias assessment through individual article evaluation. Additional domains: dose-response, strength of association, publication bias.

\*\*Single study = “consistency unknown”, may or may not be downgraded

### Assessment of Economic Studies

Full formal economic analyses evaluate both costs and clinical outcomes of two or more alternative interventions. The four primary types are cost minimization analysis (CMA), cost-utility analysis (CUA), cost-effectiveness analysis (CEA), and cost-benefit analyses (CBA). Each employs different methodologies, potentially complicating critical appraisal, but some common criteria can be assessed across studies.

No standard, universally accepted method of critical appraisal of economic analyses is currently in use. A number of checklists [Canadian, BMJ, AMA] are available to facilitate critique of such studies. The Quality of Health Economic Studies (QHES) instrument developed by Ofman, et al.<sup>7</sup> QHES embodies the primary components relevant for critical appraisal of economic studies. It also incorporates a weighted scoring process and which was used as one factor to assess included economic studies. This tool has not yet undergone extensive evaluation for broader use but provides a valuable starting point for critique.

In addition to assessment of criteria in the QHES, other factors are important in critical appraisal of studies from an epidemiologic perspective to assist in evaluation of generalizability and potential sources of study bias.

Such factors include:

- Are the interventions applied to similar populations (e.g., with respect to age, gender, medical conditions, etc.)? To what extent are the populations for each intervention comparable and are differences considered or accounted for? To what extent are population characteristics consistent with “real world” applications of the comparators?
- Are the sample sizes adequate so as to provide a reasonable representation of individuals to whom the technology would be applied?
- What types of studies form the basis for the data used in the analyses? Data (e.g., complication rates) from randomized controlled trials or well-conducted, methodologically rigorous cohort studies for data collection are generally of highest quality compared with case series or studies with historical cohorts.
- Were the interventions applied in a comparable manner (e.g., similar protocols, follow-up procedures, evaluation of outcomes, etc.)?
- How were the data and/or patients selected or sampled (e.g., a random selection of claims for the intervention from a given year/source or all claims)? What specific inclusion/exclusion criteria or processes were used?
- Were the outcomes and consequences of the interventions being compared comparable for each? (e.g., were all of the relevant consequences/complications for each intervention considered or do they primarily reflect those for one intervention?)

An outline of suggested standards for reporting stem cell studies based on Murray and Chu<sup>2,5</sup> can be found below.

**Appendix Table D11. Example of methodology for assessing reporting standards for studies of stem cell therapy**

Reporting Standards*	Author Year		
<b>Study Reporting</b>			
Randomized controlled trial - CONSORT	Yes		
Observational study - STROBE			
SR with/without meta-analysis - PRISMA			
Patient demographics	limited		
Patient comorbidities	No		
Patient medications (anti-inflammatory)	Yes		
Diagnosis/injury (chronicity, relevant grading)	Yes		
Previous interventions	Excluded		
Cell source, harvesting , time to processing*	Minimal		
Cell processing specified*	Limited		
Cell culture detailed*	N/A		
MSC characteristics*	No		
Delivery*	minimal		
Post-intervention care (PT, immobilization, etc.)	Yes		
<b>Criteria met</b>			

\* Studies must report sufficient detail to allow for evaluation and replication of methods

- Harvesting: anatomical source, equipment, reagents, storage media and environment and
- Processing: digestion methods(solutions, concentrations, volumes, duration, agitation, temperature, identification of commercial system; methods for purification and assurance of purity;
- MSC source, details of cellular composition, immunophenotype (tested in vitro), viability
- Site of delivery, suspension volume, details of media used as delivery vehicles, and if co-delivered with carriers, growth factors or scaffold

## APPENDIX E. Study Quality: Risk of Bias evaluation

**Appendix Table E1. Risk of Bias Assessment: Knee OA trials comparing autologous, non-culture-expanded BM-derived stem cells versus controls\* in different patients**

Methodological Principle	Centeno 2018	Goncars 2017	Ruane 2019	Tucker 2019
<b>Study design</b>				
Randomized controlled trial	■	■	■	■
Prospective cohort study				
Retrospective cohort study				
Case-control				
Case-series				
Random sequence generation†	Yes	Unclear	Unclear	Unclear
Concealed allocation†	Unclear	No	No	Unclear
Intention to treat†	Unclear	Yes	Yes	Yes
Independent or blind assessment	No	No	No	Yes
Complete follow-up of ≥80%	Unclear	Yes	Yes	Yes
<10% difference in follow-up between groups	Unclear	Yes	No	Yes
Controlling for possible confounding‡	Unclear	Unclear	Yes	Unclear
<b>Risk of Bias</b>	<b>Moderately High</b>	<b>Moderately High</b>	<b>Moderately High</b>	<b>Moderately High</b>

Unclear indicates that the study had insufficient detail to determine whether criteria were met

\*Centeno = Exercise control group; Goncars = Hyaluronic acid (HA) control group

†Applies only to randomized controlled trials.

‡Groups must be comparable on a robust set of baseline characteristics or present evidence that controlling of confounding presented was performed.

Investigator Notes:

**Centeno 2018:**

- **Concealed allocation:** only says that “enrollment randomization envelopes [were kept] blinded until time of enrollment by study coordinator” but does specify process by which that was carried out.
- **ITT:** Point of randomization unclear; appears to have been when consent provided, rationale for physician exclusion of patients not clear (see below); unclear how withdrawals during treatment were analyzed by 3 months; all exercise group crossed over at 3 months.
- **Independent/blind assessment:** primary outcomes were patient-reported and patients were not blinded to treatments (stem cells vs. exercise)
- **Follow-up:** patients crossed over after 3 months; data on attrition not provided; withdrawals appeared to be AFTER randomization based on text – CONSORT diagram does not indicate where randomization was done and is inconsistent with text.
  - If randomization occurred and time of consent, it appears that 7 individuals were withdrawn (4 voluntarily, 3 by physician no rationale provided)
  - 14 total appear to have withdrawn after randomization, 4 voluntarily, 7 by investigator (for having additional therapies and an additional 3 who had TKA) based on results text
  - If 7 withdrawn at time of consent and an addition 14 withdrew after treatment delivered, follow-up is 34/55 or 62%
  - N’s for outcomes at follow-up times NR
- **Confounding:** only limited patient demographics provided; baseline scores for outcome measures not presented except via figure (cannot determine if LEAS and SF-12 physical are comparable at baseline)
- **Funding:** Industry

**Goncars 2017:**

- **Randomization, Concealed allocation:** No information/statement provided regarding either criteria; Only states that enrolled pts were randomized 1:1
- **Independent/blind assessment:** primary outcomes were patient-reported and patients were not blinded to treatments (stem cells vs. HA); no mention of assessors/assessor blinding either
- **Confounding:** No Table 1 outlining baseline characteristics; no statement that groups were found to be/not to be comparable at baseline; Figure 1 includes age, sex and K-grade only for both groups – difference in age (53.4 vs. 58.6 years) and sex (54% vs. 36% male) relevance unclear (KL grade comparable b/w groups) due to small sample sizes. Baseline outcomes data not reported.
- **Funding:** NR

**Ruane:**

- **Randomization, Concealed allocation:** Unclear how randomization was performed; protocol states that “the randomization allocation schedule will be developed by the research team member performing the statistical analyses and will not be shared with the remainder of the research team” but does not provided specifics; unclear if criteria described meets concealed allocation
- **Independent/blind assessment:** patient reported outcomes and it does not appear that the patients were blinded per the following statement: “The primary investigator (i.e., the physician providing the treatment) will not be blinded to group allocation as knowledge of group allocation will be essential to deliver two distinctly different treatment procedures and to provide the participant with an explanation of the clinical procedure prior to initiating the treatment.”
- **F/U:** 84% (27/32); 76% (13/17) BMC vs. 93% (14/15)
- **Confounding:** Difference in baseline demographics and previous procedures; however protocol states that the statistical methods employed would control for baseline imbalances.

**Tucker:**

- **Randomization, Concealed allocation:** Unclear how randomization was performed; protocol states that “Access to the randomization code will be strictly controlled and only the processing technician, who will not be involved in safety or efficacy evaluation, will know to which group the subject is randomized on the day of the surgery”; unclear if criteria described meets concealed allocation
- **Confounding:** List of baseline demographics not robust; no mention of controlling in the protocol

**Appendix Table E2. Risk of Bias Assessment: Knee OA trials comparing autologous, non-culture-expanded BM-derived stem cells versus placebo in knees in the same patient.**

Methodological Principle	Shapiro 2017/2018
<b>Study design</b>	
Randomized controlled trial	■
Prospective cohort study	
Retrospective cohort study	
Case-control	
Case-series	
Random sequence generation*	Yes
Concealed allocation*	No
Intention to treat*	N/A
Accounting for repeated measures (knees in same patient)	Yes (paired Wilcoxon signed rank test)
Independent or blind assessment	Yes
Complete follow-up of $\geq 80\%$	Yes
<10% difference in follow-up between groups	N/A
Controlling for possible confounding†	N/A
<b>Risk of Bias</b>	<b>Moderately High</b>

Unclear indicates that the study had insufficient detail to determine whether criteria were met

\*Applies only to randomized controlled trials.

†Groups must be comparable on a robust set of baseline characteristics or present evidence that controlling of confounding presented was performed.

Investigator Notes:

**Shapiro 2017/2018**

- **Concealed allocation:** No statement of concealment
- **Confounding::** Demographics, patient characteristics, OA severity, prior surgery NR by treatment group; comorbidities NR; baseline outcomes score values appear comparable
- **Funding:** Private research institution (not industry)

**Appendix Table E3. Risk of Bias Assessment: Knee OA trials comparing autologous, culture-expanded stem cells versus controls\***

Methodological Principle	Emadedin 2018	Freitag 2019	Lamo-Espinosa 2016, 2018	Lee 2019	Lu 2019
<b>Study design</b>					
Randomized controlled trial	■	■	■	■	■
Prospective cohort study					
Retrospective cohort study					
Case-control					
Case-series					
Random sequence generation†	Yes	Yes	Yes	Unclear	Yes
Concealed allocation†	Yes	Unclear	Yes	No	Yes
Intention to treat†	No	No	Yes	Yes	Yes
Independent or blind assessment	Yes	No	No	Yes	Yes
Complete follow-up of ≥80%	Yes	Yes	Yes	Yes	Yes
<10% difference in follow-up between groups	No	Yes‡	No§	Yes	Yes
Controlling for possible confounding**	Unclear	No	Unclear	Yes	No
<b>Risk of Bias</b>	<b>Moderately High</b>	<b>Moderately High</b>	<b>Moderately High</b>	<b>Moderately Low</b>	<b>Moderately Low</b>

Unclear indicates that the study had insufficient detail to determine whether criteria were met

\***Emadedin:** bone marrow-derived (BM) mesenchymal stems cells (MSCs) vs. placebo; **Freitag:** Adipose-derived (AD) MSCs vs. usual care; **Lamo-Espinosa:** BM-MSCs vs. hyaluronic acid (HA); **Lee:** AD-MSCs vs. placebo; **Lu:** AD multipotent progenitor cells (MPCs) vs. HA.

†Applies only to randomized controlled trials.

‡Differential loss-to-follow-up is based on the final three treatment groups.

§Based on comparison between the two intervention groups vs. the control group (differences between the two intervention groups were considered for RoB assessment as that comparison is not the focus of the review)

\*\*Groups must be comparable on a robust set of baseline characteristics or present evidence that controlling of confounding presented was performed.

Investigator Notes:

**Emadedin 2018**

- **ITT:** 2 patients randomized to MSC did not received the treatment and no explanation provided.
- **Follow-up:** overall: 88% (43/49); b/w groups: 79% (19/24) vs. 96% (24/25)

- **Confounding:** Kellgren-Lawrence (KL) grades somewhat different between groups (fewer MSC [68%] vs. placebo [83%] had KL grade 3 and more had grade 4 [21% vs. 13%] but sample sizes were small; baseline scores not reported for outcomes, only change scores given
- **Funding:** Non-profit organization

#### Freitag 2019

- **ITT:** A third treatment group (5 injections of  $40 \times 10^6$  AD-MSCs) was intended but discontinued due to “observed and reproducible moderate adverse events in a concurrently run study with the same treatment protocol (documented as increasing self-limiting pain with sequential injections at monthly intervals).” Participants that were already randomized to this treatment group and who had not yet started treatment were re-randomized to another trial group. Authors do not provided information regarding how many patients were initially randomized to this third group or the number of patients who had started treatment and therefore were excluded vs. number of patients who had not yet commenced therapy and were re-randomized; and there is no accounting for those patients that were excluded after randomization.
- **Independent/blind assessment:** primary outcomes were patient-reported and patients were not blinded to treatments (stem cells vs. conservative care)
- **Concealed allocation:** No information/statement provided
- **Follow-up:** b/w group diff; 95% vs. 100% when injection groups combined; when considered separately the rates are 90% (1 inj.) vs. 100% (2 inj.) vs. 100% (control).
- **Confounding:** limited information on patient characteristics and sample size is very small; statistical difference between groups in BMI (both treatment groups obese while control group overweight,  $p=0.02$ ); unclear if baseline KOOS symptom and ADL scores were significantly different between groups at baseline; KOOS Sport, QOL appear to be different at baseline (NOTE: all based on figures – supplemental table #3 indicates only KOOS symptom was statistically significantly different)
- **Funding:** Industry

#### Lamo-Espinosa 2016, 2018

- **Independent/blind assessment:** primary outcomes were patient-reported and patients were not blinded to treatments (stem cells vs. HA)
- **Follow-up:** 94% (30/32); 100% (low-dose; 10/10) vs. 100% (high dose; 10/10) vs. 84% (control; 10/12).
- **Confounding:** sample sizes are small; relevance of differences between groups at baseline is unclear; authors state that the groups showed uneven distribution according to the KL scale but without statistical significance; other characteristics appeared to be statistically similar though there were differences: time since OA diagnosis 3 to 4 years longer in high dose group; only 4 males in low-dose group; baseline WOMAC function and overall and WORMS may differ between groups; baseline VAS scores appear to be comparable based on figures
- **Funding:** Government (Spain)

#### Lee 2019

- **Randomization:** No description of methods used; only state that patients were “randomized”.
- **Concealed allocation:** No description of methods used; only says that “patients were blindly assigned to [groups]” but does specify process.
- **Follow-up:** 87% (47/53); 88% (23/26) vs. 89% (24/27)
- **Confounding:** baseline variables seem similar between groups, but sample size is all and SDs are very large
- **Funding:** Industry

#### Lu 2019

- **Confounding:** age was statistically different between groups and not controlled for; NS differences in other baseline variables, however for baseline measures, SD’s are large indicating substantial variability; % who had prior treatment and concomitant diagnoses were not statistically different; sample size is small.
- **Funding:** Industry & Government

**Appendix Table E4. Risk of Bias Assessment: Knee OA trials comparing allogenic, culture-expanded stem cells versus controls\***

Methodological Principle	Khalifeh Soltani 2019	Vega 2015
<b>Study design</b>		
Randomized controlled trial	■	■
Prospective cohort study		
Retrospective cohort study		
Case-control		
Case-series		
Random sequence generation†	Yes	Yes
Concealed allocation†	Unclear	Yes
Intention to treat†	Yes	Yes
Independent or blind assessment	Yes	Unclear
Complete follow-up of ≥80%	Yes	Unclear
<10% difference in follow-up between groups	Yes	Unclear
Controlling for possible confounding‡	No	Unclear
<b>Risk of Bias</b>	<b>Moderately Low</b>	<b>Moderately High</b>

Unclear indicates that the study had insufficient detail to determine whether criteria were met

\***Khalifeh Soltani**: placenta-derived mesenchymal stem cells (MSCs) vs. placebo; **Vega**: bone marrow-derived MSCs vs. hyaluronic acid.

†Applies only to randomized controlled trials.

‡Groups must be comparable on a robust set of baseline characteristics or present evidence that controlling of confounding presented was performed.

#### Investigator Notes:

##### Khalifeh Soltani

- **Concealed allocation**: no indication/statement of how or if this was done.
- **Confounding**: baseline QOL-BI (p=0.001) and ROM (p=0.007) differed statistically b/w groups; ADL seem different; small sample size
- **Funding**: Private research institution (not industry)

##### Vega 2015

- **ITT**: benefit of the doubt given as it appears based on numbers in results tables that all patients were analyzed according to the group they were randomized to.
- **Independent/blind assessment**: authors state that participants, providers, and radiologists were blinded AFTER group assignment; unclear what this means.
- **Follow-up**: no consort diagram and no description of how many patients were eligible, how many enrolled, how many randomized and received treatment and therefore follow-up cannot be calculated; also further indication of loss-to-follow-up not provided by authors.
- **Controlling**: baseline variables provided in table 2 appear fairly similar b/w groups (KL grade; previous surgeries; more controls had steroids, more MSCs had PRP?); however, some differences in the baseline outcome measures scores (e.g., VAS 10 points higher in control group) – small sample size makes relevance unclear.
- **Funding**: Government (Spain)

**Appendix Table E5. Risk of Bias Assessment: Knee OA nonrandomized cohort study evaluating autologous, non-culture-expanded bone marrow-aspirate concentrate stem cells**

	Autologous, non-culture-expanded BM-MSCs	Allogenic (amniotic fluid) stem cells

Prospective Case Series	
Retrospective Case Series	
Random sequence generation*	Yes
Concealed allocation*	Yes
Intention-to-treat*	Unclear
Independent/blind assessment	No (patient-reported) §
Complete follow-up of $\geq 80\%$	Unclear**
<10% difference in follow-up between groups	Yes
Controlling for possible confounding†	Unclear††
<b>Risk of Bias</b>	<b>Moderately High</b>

\*Applies only to randomized controlled trials

†Groups must be comparable on baseline characteristics or evidence of control for confounding present

§ Authors state that patients and assessors were “blinded after assignment”, thus patient-reported outcomes do not appear to have been blinded, although radiographic measures were blinded.

\*\* Authors do provide enough information on the screening process or number of eligible patients to adequately determine

follow-up or if ITT was followed.

†† Group population characteristics were not reported separately. No table of baseline demographics by group provided.

**Appendix Table E8. Risk of Bias for RCTs of Tendinopathies**

Methodological Principle	Uselli 2018
Study design	
Randomized controlled trial	■
Prospective cohort study	
Retrospective cohort study	
Case-control	
Case-series	
Random sequence generation*	Unclear
Concealed allocation*	Yes
Intention to treat*	Yes
Independent or blind assessment	Yes (assessor) No (patients)
Complete follow-up of $\geq 80\%$	Yes
<10% difference in follow-up between groups	Yes
Controlling for possible confounding†	No
<b>Risk of Bias</b>	<b>Moderately high</b>

Unclear indicates that the study had insufficient detail to determine whether criteria were met

\*Applies only to randomized controlled trials.

†Groups must be comparable on a robust set of baseline characteristics or present evidence that controlling of confounding presented was performed.

- 67% of the AD-SVF group vs. 35% of the PRP group were male; the AD-SVF group were slightly older; more patients in the SVF group (7/21) vs. the PRP group (5/23) had bilateral treatment.
- Authors report that radiologists and assessors were blinded but make no statement that patients were blinded to treatment allocation and adipose tissue appears to have been harvested only from patients assigned to the SVF group. For patient reported outcomes (e.g. VAS pain), there is a potential for bias.

**Appendix Table E9. Methodological quality of registry studies assessing stem cell therapies.**

Methodological principle	Centeno 2014 (Hip OA)§ Centeno 2015 (Shoulder OA/Rotator Cuff Tear)§ Centeno 2018 (ACL Tear)§ Centeno 2014 (Knee OA)§ Centeno 2016 (safety specific – mixed conditions)§
Study comparing treatment options?	No (case series)
Designed specifically for condition evaluated	No
Includes prospective data only	Unclear
Validation of completeness and quality of data	Unclear
Patients followed long enough for outcomes to occur	Yes (short-term) No (long-term)
Independent outcome assessment*	Yes
Complete follow-up of $\geq 80\%$	No
Controlling for possible confounding†	No
Accounting for time at risk‡	Unclear/not comparative study
<b>Risk of Bias</b>	<b>High</b>

\* Outcome assessment is independent of healthcare personnel judgment. Some examples include patient reported outcomes, death, and reoperation.

† Authors must provide a description of robust baseline characteristics, and control for those that are unequally distributed between treatment groups.

‡ Equal follow-up times or for unequal follow-up times, accounting for time at risk.

§This HTA has included 5 registry studies from the same author group as part of its evidence base. The evaluation above applies to all studies using this registry.

	direction, or (iv) osteo chondritis desicans. 2. Subjects who have had surgery of either knee within 6 months prior to the screening visit. 3. Subjects who have had a major injury to the targeted knee within 12 months prior to enrolling in the study. 4. Subjects who have had an injection in either knee in the prior 3 months, including corticosteroids, viscosupplementation or platelet rich plasma (PRP). 5. Subjects who have gout, rheumatoid arthritis, lupus arthropathy, psoriatic arthritis, avascular necrosis, severe bone deformity, infection of the knee joint, fibromyalgia, pes anserine bursitis, or neurogenic or vascular claudication. 6. Subjects who have symptomatic OA of the hips, spine, or ankle that would interfere with the evaluation of the treated knee. 7. Subjects that are unwilling to stop taking prescription or over the counter pain medication 7 days prior to any visit

BM was processed by hand in a biologic safety cabinet to isolate the buffy coat to create BMC from which the total nucleated cell count was calculated. Concurrently, ~100 cc of venous blood was drawn and concentrated into two portions of leukocyte poor PRP by centrifuging the blood and extracting the plasma and buffy coat layers. One portion of PRP was set aside for injection and the other portion underwent further processing into platelet lysate via a freeze-thawing method.</p> <p><b>Cell Expansion:</b> No</p> <p><b>Cell Concentration:</b> NR</p> <p><b>Cell Delivery:</b> Using fluoroscopy, needle placement into the intra-</p>	<p><i>Prolotherapy + BMAC + PRP + PL + steroids + PT vs. Exercise</i></p> <p><b>Mean age:</b> 54 vs. 57 years</p> <p><b>Mean BMI:</b> 26 vs. 26 lbs/in<sup>2</sup></p> <p><b>KL OA grade</b></p> <p>II: 42% vs. 45%</p> <p>III: 58% vs. 55%</p>	<p><u>F/U</u></p> <p>1.5 months</p> <p>3 months</p> <p>6 months</p> <p>12 months</p> <p>24 months</p> <p><u>% Followed</u></p> <p>70.8% (34/48)</p>	<ul style="list-style-type: none"> <li>Knee Society Function Score (KSS-function) (0-100, higher=increased function)</li> <li>Knee Society Knee Score (KSS-knee score) (0-100, higher=ROM and decreased pain)</li> <li>Short form-12 life quality questionnaire (SF-12) (0-100, higher=increased QOL)</li> <li>Pain visual analogue scale (VAS) (0-100, higher=increased pain)</li> <li>Lower Extremity Activity Scale (LEAS) (1-18, lower=greater disability)</li> </ul>	<p><b>Funding:</b> Industry</p> <p><b>COI:</b> CC is a shareholder and CMO of Regenexx, LLC. \* 1 week, 3 month, and 6 month data for WOMAC-general, WOMAC-pain, VAS-pain, and Lequesne are estimated from graphs.

† To include menstrual disorders, influenza, migraine, toothache, restlessness, memory loss, testicular pain, rhinitis, sensitive hand alteration, sleepiness, allergic reaction, tinnitus, dental implant, lipoma, skin tumor.

‡ SDs are estimated from Figure 4

§ Estimated from Figure 6

\*\* Authors indicate that only the patients who had been treated with BM-MSCs met criteria to be considered WOMAC responders in the long term (12 and 48 months). According to previous literature, patients were considered WOMAC responders when they reported an improvement of 20 % in at least two items together with an improvement of ten points in the overall scale.

†† All data for WOMAC scores, including WOMAC-total, were abstracted from Supplemental Table S1. There was a discrepancy between the text and Table S1 in terms of what was reported for WOMAC-general scores. The decision was made to abstract all data from the supplemental Table S1.

‡‡ The most common adverse events were transient pain and swelling of injection-site joint, all of which were mild to moderate and were spontaneously relieved within 7 days without special treatment.

§§ Authors do not define what the PASS values were set at.

\*\*\* While authors report KOOS scores data, the supplemental graphs from which this data would be derived are of too poor quality to gather accurate data and this have not been reported here.

††† All data without an SD was estimated from figures.

‡‡‡ All exercise therapy patients crossed-over to receive a BMC injection at 3 months so the majority of these patients had received a BMC injection at some point.

**Appendix Table F3: Study characteristics, demographics, and data abstraction for case series and treatment registries evaluating the safety of stem cell therapies for knee osteoarthritis**

	noncorrected endocrine disorder that might impact pain condition (i.e., hypothyroidism and diabetes); (iii) active neurologic disorder that might impact pain condition (i.e., peripheral neuropathy and multiple sclerosis); (iv) pulmonary and cardiac disease uncontrolled with medication usage; (v) history of active neoplasm within the past five years; (vi) blood disorders documented by abnormal complete blood count within three months including severe anemia, thrombocytopenia, leukocytosis and/or leukopenia; and (vii) medical conditions precluding the injection procedures.	<p><b>Cell Delivery:</b> ultrasound guided injection</p> <p><b>Anesthetic Use:</b> Yes – 2% lidocaine</p> <p><b>Number of injections:</b> 1 injection of Adipose-derived MSCs, PRP, HA, and CaCl<sub>2</sub> followed by 1 weekly injection of PRP for 4 weeks.</p> <p><b>Co-interventions:</b> Three patients received two injections of stem cells on the same knee joints.</p> <p><b>Post treatment protocol:</b> The patients were then instructed to remain still for 30 minutes to allow for cell attachment. As they were discharged to home, the patients were instructed to maintain activity as tolerated.</p>		12 months: 100% (100/100 procedures) 24 months: 78% (78/100 procedures) 30 months: (17/100 procedures)		

AD = adipose; AE = adverse events; BM = bone marrow; BMAC = bone marrow aspirate concentrate; BMC = bone marrow concentrate; BMI = body mass index; BM-MNCs = bone marrow mononuclear cells; BM-MSCs = bone marrow derived mesenchymal stem/stromal cells; CE = culture expanded; COI = conflict of interest; F/U = follow-up; MCS = mental component score; NSAID = non-steroid anti-inflammatory drug; PRP = platelet rich plasma; ROB = risk of bias; SD = standard deviation;

\* A patient was considered lost to follow-up when they failed to respond for three successive time points despite three attempts at contact at each time point. However, a patient who failed to respond to one time point may be "reacquired" at a later time point when they did respond

† 4 were self-limiting, 2 resolved with knee effusion drained via arthrocentesis, and 3 required joint arthroplasty

‡ An additional infection was identified by unconfirmed by his treating physician and not adjudicated as a possible complication

§ The higher number of procedures than patients indicates both serial procedures that occurred at different times and/or bilateral or multiple joint procedures that occurred in the same treatment session.

\*\*This severe report of pain was not reported on in the literature, but I found it by going through the spreadsheet of events sent to us by Centeno. The study reports that there were no adjudicated severe adverse events but this was very clearly adjudicated according to the spread sheet. It states, "Patient was obese which made the procedure technically challenging"

**Appendix Table F19. Non-treatment related AEs reported by across case series assessing cultured/expanded cells in patients with knee OA**

Author Year	Age	% Male	Stem Cell Type	Source	Concentration	F/U (mos.)	AE	%	n	N

Title	Conditions	Interventions / Control	Study Design	N	Trial Number
<b>Osteoarthritis</b>					
Bone Marrow Aspirate Compared to Platelet Rich Plasma for Treating Knee Osteoarthritis	Knee OA	Pure PRP II vs. Pure BMC	RCT	120	<a href="#">NCT03289416</a>
Efficacy of Micro-fragmented Adipose Tissue Injection for Knee Osteoarthritis.	Knee OA	Microfragmented Adipose Tissue (Lipogems) vs. Corticosteroid injection vs. Saline	RCT	100	<a href="#">NCT03379168</a>
Conventional Platelet-Rich Plasma Versus Concentrated Bone Marrow Stem Cell Injections for Osteoarthritis of the Knee	Knee OA	Concentrated Bone Marrow Aspirate (BMAC) vs. Platelet-Rich Plasma (PRP)	RCT	24	<a href="#">NCT03271229</a>
Intra-articular Transplantation of Autologous Adipose Derived Stromal Vascular Fraction (SVF) for Treatment of Osteoarthritis of the Knee	Knee OA	Autologous Adipose-Derived SVF (Stromal Vascular Fraction) vs. Placebo	RCT	30	<a href="#">NCT03940950</a>
Adipose-derived SVF for the Treatment of Knee OA	Knee OA	Low-dose SVF vs. High-dose SVF vs. Placebo	RCT	39	<a href="#">NCT02726945</a>
A Phase 2 Study to Evaluate the Efficacy and Safety of JointStem in Treatment of Osteoarthritis	Knee OA	JointStem (autologous adipose tissue derived mesenchymal stem cells) vs. Synvisc-One (Hyalronic Acid)	RCT	28	<a href="#">NCT02674399</a>
Adipose-Derived Stem Cell Injections for Knee Osteoarthritis	Knee OA	Autologous Adipose-derived Stem Cell injection vs. Corticosteroid injection	RCT	40	<a href="#">NCT03467919</a>
Healing Osteoarthritic Joints in the Wrist With Adult ADRCs	Wrist OA	Adipose-derived stem cell injection vs. Corticosteroid injection	RCT	40	<a href="#">NCT03503305</a>
Safety of Adipose-derived Regenerative Cells Injection for Treatment of Osteoarthritis of the Facet Joint	Facet Joint OA	Adipose-derived stem cell injection vs. Corticosteroid injection	RCT	40	<a href="#">NCT03513731</a>

Title	Conditions	Interventions / Control	Study Design	N	Trial Number
Multicenter Trial of Stem Cell Therapy for Osteoarthritis (MILES)	OA	Autologous Bone Marrow Concentrate (BMAC) vs. Adipose-derived Stromal Vascular Fraction (SVF) vs. Biological: Umbilical Cord Tissue (UCT) vs. Depomedrol and Normal saline (Corticosteroid injection)	RCT	480	<a href="#">NCT03818737</a>
Effect of Implanting Allogenic Cytokines Derived From Human Amniotic Membrane (HAM) and Mesenchymal Stem Cells Derived From Human Umbilical Cord Wharton's Jelly (HUMCWJ) on Pain and Functioning of Knee Osteoarthritis	Knee OA	Human Amniotic Membrane and Mesenchymal Stem Cells Derived From Human Umbilical Cord Wharton's Jelly Injections vs. Wait List Control	Comparative Cohort	60	<a href="#">NCT03337243</a>
Injections of FloGraft Therapy, Autologous Stem Cells, or Platelet Rich Plasma for the Treatment of Degenerative Joint Pain	OA	FloGraft Therapy vs. Autologous Stem Cells vs. Platelet Rich Plasma	Comparative Cohort	300	<a href="#">NCT01978639</a>
Correlating the OA Knee Microenvironment to Outcomes After Regenexx-SD Treatment: A Multi-Site Study	Knee OA	Bone Marrow Concentrate	Case series	600	<a href="#">NCT03898388</a>
Evaluation of Safety and Exploratory Efficacy of an Autologous Adipose-derived Cell Therapy Product for Treatment of Single Knee Osteoarthritis	Knee OA	Autologous Adipose-derived Stromal Vascular Fraction	Case series	125	<a href="#">NCT04043819</a>
Impact of Mesenchymal Stem Cells in Knee Osteoarthritis	Knee OA	Autologous Mesenchymal Stem Cells	Case series	16	<a href="#">NCT03477942</a>
Intra-articular Autologous Bone Marrow Aspirate Injection for Knee Osteoarthritis	Knee OA	BMA Injection	Case series	13	<a href="#">NCT03130335</a>
Safety & Effectiveness of Autologous Regenerative Cell Therapy on Pain & Inflammation of Osteoarthritis of the Hip	Hip OA	StroMed + platelet rich plasma (PRP) injection	Case series	4000	<a href="#">NCT02844764</a>

Title	Conditions	Interventions / Control	Study Design	N	Trial Number
Safety & Effectiveness of Autologous Regenerative Cell Therapy on Pain & Inflammation of Osteoarthritis of the Shoulder	Shoulder OA	StroMed + platelet rich plasma (PRP) injection	Case series	4000	<a href="#">NCT02844738</a>
Outcomes Data of Adipose Stem Cells to Treat Osteoarthritis	OA	Autologous Adipose Stromal Vascular Fraction	Case series	100	<a href="#">NCT02241408</a>
Use of Autologous Adipose-Derived Stromal Vascular Fraction To Treat Osteoarthritis of Hip, Knee, Ankle, and Thumb Joints	OA	SVF injection	Case series	500	<a href="#">NCT03166410</a>
Safety and Clinical Effectiveness of A3 SVF in Osteoarthritis	OA	Autologous Adipose Stromal Vascular Fraction	Case series	30	<a href="#">NCT01947348</a>
Autologous <b>Culture Expanded</b> Adipose Derived MSCs for Treatment of Painful Hip OA	Hip OA	Autologous Adipose Derived Mesenchymal Stromal Cells (Single injection vs. Two injections)	RCT	24	<a href="#">NCT03608579</a>
Autologous <b>Culture Expanded</b> Mesenchymal Stromal Cells for Knee Osteoarthritis	Knee OA	Autologous Adipose-Derived Mesenchymal Stromal Cells (various doses)	Comparative Cohort	24	<a href="#">NCT02805855</a>
<b>Degenerative Disc Disease</b>					
Mesenchymal Stem Cells for Lumbar Degenerative Disc Disease	DDD	MSC Treatment group 1 (low dose) vs. MSC Treatment group 2 (high dose) vs. Healthy Control (no treatment)	RCT	24	<a href="#">NCT03692221</a>
Study to Evaluate the Safety and Preliminary Efficacy of IDCT, a Treatment for Symptomatic Lumbar Intervertebral Disc Degeneration	DDD	Discogenic Cells + Sodium Hyaluronate Vehicle (low dose) vs. Discogenic Cells + Sodium Hyaluronate Vehicle (high dose) vs. Saline Solution vs. Sodium Hyaluronate	RCT	60	<a href="#">NCT03347708</a>
A Prospective Study of Clinical Outcomes Following a Single Intradiscal Injection of Bone Marrow Aspirate Concentrate (BMAC) for Single Level Discogenic Low Back Pain	DDD	Autologous Bone Marrow Aspirate Concentrate (BMAC) Injection	Case series	20	<a href="#">NCT03912454</a>
Autologous, <b>Culture-Expanded</b> Mesenchymal Stromal Cells for Degenerative Disc Disease	DDD	Autologous Adipose-Derived Mesenchymal Stromal Cells (low vs. high dose)	Comparative Cohort	16	<a href="#">NCT03461458</a>

Title	Conditions	Interventions / Control	Study Design	N	Trial Number
<b>Rotator Cuff Tear</b>					
Safety and Efficacy of Adult Adipose-Derived Stem Cell Injection Into Partial Thickness Rotator Cuff Tears	Rotator Cuff Tear	Adipose-derived stem cells vs. Cortisone injection	RCT	15	<a href="https://clinicaltrials.gov/ct2/show/study/NCT04077190">NCT04077190</a>
Stromal Vascular Fraction Cell Therapy to Improve the Repair of Rotator Cuff Tears	Rotator Cuff Tear	Autologous Stromal Vascular Fraction Material vs. Ringer's solution	RCT	56	<a href="https://clinicaltrials.gov/ct2/show/study/NCT03332238">NCT03332238</a>
Regenexx <sup>®</sup> , SD Versus Exercise Therapy for Rotator Cuff Tears	Rotator Cuff Tear	Regenexx SD vs. Exercise Therapy	RCT	50	<a href="https://clinicaltrials.gov/ct2/show/study/NCT01788683">NCT01788683</a>
Autologous Adult Adipose-Derived Regenerative Cell Injection Into Chronic Partial-Thickness Rotator Cuff Tears	Rotator Cuff Tear	Adipose Derived Regenerative Cells vs. Corticosteroid	RCT	246	<a href="https://clinicaltrials.gov/ct2/show/study/NCT03752827">NCT03752827</a>
<b>Other</b>					
Use of Bone Marrow Concentrate for Treatment of Alar, Accessory, and Transverse Ligament Injuries	Cranio cervical Injuries	Bone Marrow Concentrate treatment vs. Sham Control	RCT	80	<a href="https://clinicaltrials.gov/ct2/show/study/NCT03517761">NCT03517761</a>
Regenexx Versus Exercise Therapy for ACL Tears	ACL Tear	Regenexx SD vs. Exercise Therapy	RCT	50	<a href="https://clinicaltrials.gov/ct2/show/study/NCT01850758">NCT01850758</a>
<b>Mixed Conditions</b>					
Cellular & Biocellular Regenerative Therapy in Musculoskeletal Pain, Dysfunction, Degenerative or Inflammatory Disease	Mixed Conditions	Tissue Stromal Vascular Fraction vs. Normal Saline vs. Platelet Rich Plasma vs. Cellular Stromal Vascular Fraction	Comparative Cohort	300	<a href="https://clinicaltrials.gov/ct2/show/study/NCT03090672">NCT03090672</a>
Evaluation of Outcomes With Amniotic Fluid for Musculoskeletal Conditions Musculoskeletal Conditions	Mixed Conditions	Amniotic	Case series	200	<a href="https://clinicaltrials.gov/ct2/show/study/NCT03390920">NCT03390920</a>
Clinical Outcomes of Autologous Bone Marrow Aspirate Concentrate Injections for Musculoskeletal Conditions	Mixed Conditions	Bone Marrow Aspirate Concentrate Injection	Case series	300	<a href="https://clinicaltrials.gov/ct2/show/study/NCT02981394">NCT02981394</a>

Title	Conditions	Interventions / Control	Study Design	N	Trial Number
A Clinical Registry of Orthobiologics Procedures	Mixed Conditions	Orthobiologic Procedures	Case series	50000	<a href="#">NCT03011398</a>

**Appendix Table G2. Current trials of stem cell therapy in countries outside of the USA**

Title	Conditions	Interventions	Country	Trial Number
<b>Osteoarthritis</b>				
Clinical Trial to Compare ReJoin™ to Sodium Hyaluronate Injection for Knee Osteoarthritis Cartilage Defects	Knee OA	Biological: ReJoin™   Drug: Sodium Hyaluronate	China	<a href="#">NCT02855073</a>
The Comparison of Efficacy and Safety of the Mesenchymal Stem Cells From Adipose and Hyaluronic Acid	Knee OA	Biological: Mesenchymal Stem Cells from adipose   Biological: Hyaluronic Acid	China	<a href="#">NCT03357575</a>
Autologous Micro-fragmented Adipose Tissue Injection for Knee Osteoarthritis	Knee OA	Device: Lipogems	China	<a href="#">NCT03788265</a>
Clinical Study of Pulp Mesenchymal Stem Cells in the Treatment of Primary Mild to Moderate Knee Osteoarthritis	Knee OA	Biological: Low Dose of Mesenchymal stem cell   Biological: High Dose of Mesenchymal stem cell   Drug: Sodium Hyaluronate	China	<a href="#">NCT04130100</a>
Mesenchymal Stem Cell Transplantation for Osteoarthritis	Knee OA	Biological: Autologous BMSCs plus autologous PRP   Biological: Autologous PRP	China	<a href="#">NCT03969680</a>
Treatment of Early Knee Osteoarthritis With Autologous Adipose-derived Mesenchymal Stem Cells	Knee OA	Drug: Autologous adipose-derived mesenchymal stem cells   Procedure: abdominal liposuction	China	<a href="#">NCT03956719</a>
Effectiveness of Autologous Adipose-derived Stem Cells in the Treatment of Knee Cartilage Injury	Knee OA	Other: Autologous Adipose-derived Mesenchymal Stem Cell Gel   Drug: Sodium Hyaluronate   Procedure: Extraction of abdominal fat	China	<a href="#">NCT03955497</a>

Title	Conditions	Interventions	Country	Trial Number
The Maximum Tolerated Dose of Mesenchymal Stem Cells From Umbilical Cord	Knee OA	Drug: mesenchymal stem cells	China	<a href="#">NCT03357770</a>
Clinical Study of Umbilical Cord Mesenchymal Stem Cells (UC-MSC) for Treatment of Knee Osteoarthritis	Knee OA	Biological: Umbilical-cord mesenchymal stromal cells (UC-MSCs) Other: Hyaluronic acid	China	<a href="#">NCT03166865</a>
The Safety/Efficacy of Human Umbilical Cord Mesenchymal Stem Cells Therapy for Patients With Osteoarthritis	Knee OA	Biological: Low dose mesenchymal stem cells Biological: High dose mesenchymal stem cells Procedure: Intraarticular injection	China	<a href="#">NCT03383081</a>
Intra-articular Injection of MSCs in Treatment of Knee OA	Knee OA	Biological: Placenta Derived Mesenchymal Stem Cell Drug: Sodium Hyaluronate	China	<a href="#">NCT03028428</a>
Very Small Embryonic-like Stem Cells for Knee Osteoarthritis	Knee OA	Biological: very small embryonic-like stem cell	China	<a href="#">NCT03975101</a>
Evaluating Safety and Efficacy of Mesenchymal Stem Cells From Umbilical Cord	Knee OA	Drug: mesenchymal stem cells from umbilical cord	China	<a href="#">NCT03358654</a>
A Study Evaluating the Efficacy of a Single Injection Autologous Adipose Derived Mesenchymal Stromal Cells in Patients With Knee Osteoarthritis	Knee OA	Biological: Injection (2x10 <sup>6</sup> ASC/5ml). Biological: Injection (10x10 <sup>6</sup> ASC/5ml). Other: Placebo	France	<a href="#">NCT02838069</a>
Transplantation of Bone Marrow Stem Cells Stimulated by Proteins Scaffold to Heal Defects Articular Cartilage of the Knee	Knee OA	Procedure: Transplantation of Bone Marrow Stem Cells Activated in Knee Arthrosis	France	<a href="#">NCT01159899</a>
Safety and Efficacy of Autologous Bone Marrow Stem Cells for Treating Osteoarthritis	Knee OA	Other: Autologous bone marrow stem cells	India	<a href="#">NCT01152125</a>
Mesenchymal Stem Cells Enhanced With PRP Versus PRP In OA Knee	Knee OA	Biological: Mesenchymal stem cell suspension Biological: PRP	India	<a href="#">NCT01985633</a>
Implantation of Allogenic Mesenchymal Stem Cell From Umbilical Cord Blood for Osteoarthritis Management	Knee OA	Drug: Hyaluronic Acid Biological: Umbilical Cord Mesenchymal Stem Cell Biological: Recombinant Human Somatropin	Indonesia	<a href="#">NCT03800810</a>

Title	Conditions	Interventions	Country	Trial Number
Stem Cell Transplantation for the Treatment of Knee Osteoarthritis	Knee OA	Biological: Autologous Stem Cell Transplantation	Iran	<a href="#">NCT00550524</a>
The Effects of Stromal Vascular Fraction and Mesenchymal Stem Cells as Intra-articular Injection in Knee Joint Osteoarthritis	Knee OA	Biological: Mesenchymal stem cell   Biological: Placebo	Iran	<a href="#">NCT03164083</a>
Treatment for Knee Osteoarthritis With Injections of BMC at the Bone-cartilage Interface. Pilot Study	Knee OA	Biological: Injection of autologous concentrated bone marrow aspirate	Italy	<a href="#">NCT03110666</a>
Evaluation of Effectiveness of Combined Intra-articular and Intra-osseus Injection VS a Single Intra-articular Injection of Bone Marrow Concentrate	Knee OA	Biological: Bone Marrow Concentrate	Italy	<a href="#">NCT03876795</a>
Randomized Double-blind Study on the Treatment of Osteoarthritis of the Bilateral Knee: Autologous Bone Marrow Concentrate vs. Hyaluronic Acid	Knee OA	Biological: injection of autologous bone marrow concentrate   Biological: injection of hyaluronic acid.	Italy	<a href="#">NCT03110679</a>
Subchondral and Intra-articular Application of Bone Marrow Concentrate for Knee Unicompartmental OA	Knee OA	Biological: Subchondral and intra-articular injection of BMC	Italy	<a href="#">NCT03790189</a>
Use of Adipose Tissue Derived Mesenchymal Stem Cells for Knee Osteoarthritis	Knee OA	Biological: Adipose tissue derived mesenchymal stem cell	Jordan	<a href="#">NCT02966951</a>
Use of Wharton Jelly Derived Mesenchymal Stem Cells for Knee Osteoarthritis	Knee OA	Biological: Wharton Jelly derived mesenchymal stem cell	Jordan	<a href="#">NCT02963727</a>
Safety of Allogeneic Bone Marrow Derived Mesenchymal Stem Cells in Subjects With Osteoarthritis	Knee OA	Biological: Human allogeneic mesenchymal bone marrow derived stem cells	Mexico	<a href="#">NCT03602872</a>
Autologous Stromal Vascular Fraction of Cells for Treatment of Knee Articular Cartilage Dystrophy	Knee OA	Procedure: Liposuction   Other: SVF isolation   Other: Intraarticular administration of autologous SVF	Russia	<a href="#">NCT02827851</a>
Knee Osteoarthritis Treatment With Adipose-derived Stem Cells: Phase II Clinical Trial	Knee OA	Biological: Stem cells	Saudi Arabia	<a href="#">NCT03308006</a>

Title	Conditions	Interventions	Country	Trial Number
The Evaluation of Safety and Effectiveness of Intraarticular Administration of Autologous Stromal-Vascular Fraction of Adipose Tissue Cells for Treatment of Knee Joint Arthrosis	Knee OA	Biological: Stromal-vascular fraction	Serbia	<a href="#">NCT04050111</a>
A Phase 3 Study to Evaluate the Efficacy and Safety of JointStem in Treatment of Osteoarthritis	Knee OA	Biological: JOINTSTEM Drug: saline	South Korea	<a href="#">NCT03990805</a>
Follow-up Study for Participants Jointstem Clinical Trial	Knee OA	Drug: Jointstem	South Korea	<a href="#">NCT03509025</a>
Evaluate Safety and Explore Efficacy of SMUP-IA-01 in Patients With Knee Osteoarthritis	Knee OA	Biological: SMUP-IA-01(low-dose) Biological: SMUP-IA-01(mid-dose) Biological: SMUP-IA-01(high-dose)	South Korea	<a href="#">NCT04037345</a>
Treatment of Osteoarthritis by Intra-articular Injection of Bone Marrow Mesenchymal Stem Cells With Platelet Rich Plasma	Knee OA	Biological: 100 million Bone marrow mesenchymal stem cells Biological: Platelet Rich plasma (PRGF)	Spain	<a href="#">NCT02365142</a>
Clinical Investigation to Compare the Safety and Efficacy of Cellular Matrix to Those of Ostenil <sup>®</sup> Plus and to Those of PRP Only	Knee OA	Device: Cellular Matrix / A-CP HA Device: Ostenil <sup>®</sup> Plus Device: RegenKit-BCT-1	Switzerland	<a href="#">NCT02964143</a>
Adipose-derived Stem Cells (ADSCs) for Knee Osteoarthritis	Knee OA	Biological: Elixcyte 8 ml Device: Hya Joint Plus Biological: Elixcyte 4 ml Biological: Elixcyte 2 ml	Taiwan	<a href="#">NCT02784964</a>
A Dose- Escalation Phase I Study to Evaluate Safety and Phase II Study to Evaluate Efficacy of GXPC1 to Osteoarthritis	Knee OA	Drug: GXPC1 Device: HA	Taiwan	<a href="#">NCT03943576</a>
Allogeneic Bone Marrow MSC Therapy for Knee Osteoarthritis	Knee OA	Biological: Chondrochymal <sup>®</sup>	Taiwan	<a href="#">NCT03589287</a>
Mesenchymal Stem Cell Treatment for Primary Osteoarthritis Knee	Knee OA	Drug: Adipose-Derived Mesenchymal Stem Cells	Taiwan	<a href="#">NCT02544802</a>
BMAC in Severe Hip or Knee Osteoarthritis Awaiting Arthroplasty	Knee & Hip OA	Biological: Bone Mineral Aspirate Concentrate (BMAC)	Canada	<a href="#">NCT03908827</a>
BMA vs Cortisone for Glenohumeral Osteoarthritis	Shoulder OA	Drug: Cortisone Biological: Bone Marrow Aspirate	Canada	<a href="#">NCT03580148</a>

Title	Conditions	Interventions	Country	Trial Number
Bone Marrow Aspirate Concentrate Use in Hip Osteoarthritis	Hip OA	Procedure: BMAC/PRP Injection   Procedure: Cortisone Injection	Canada	<a href="#">NCT03410355</a>
The Combined Use of PRP With Lipoaspirate and/or Bone Marrow Aspirate in Osteoarthritis	OA	Biological: Autologous cell therapy	Canada	<a href="#">NCT03984461</a>
Intra-Articular Autologous Bone Marrow Mesenchymal Stem Cells Transplantation to Treat Mild to Moderate Osteoarthritis	OA	Drug: Hyaluronic Acid   Biological: Autologous bone marrow-derived mesenchymal stem cells	Malaysia	<a href="#">NCT01459640</a>
Adipose-derived Mesenchymal Stem Cells in Osteoarthritis	OA	Biological: Intra-articular injection of ADMSC	Poland	<a href="#">NCT03869229</a>
Wharton's Jelly-derived Mesenchymal Stem Cells in Osteoarthritis	OA	Biological: Intraarticular injection of WJMSC	Poland	<a href="#">NCT03866330</a>
<b>Tendon and Ligament Conditions</b>				
Treatment of Tendon Injury Using Mesenchymal Stem Cells	Lateral Epicondylitis	Biological: ALLO-ASC(allogeneic adipose derived mesenchymal stem cell) injection	South Korea	<a href="#">NCT01856140</a>
Treatment of Intractable Common Extensor Tendon Injury Using Mesenchymal Stem Cells (Allo-ASC)	Lateral Epicondylitis	Biological: High concentration of Allo-ASC   Biological: Low concentration of Allo-ASC   Drug: Fibrin glue   Drug: Normal saline	South Korea	<a href="#">NCT03449082</a>
Treatment of Tendon Disease Using Autologous Adipose-derived Mesenchymal Stem Cells	Rotator Cuff Tear & Lateral Epicondylitis	Biological: Autologous adipose-derived MSCs   Drug: Compound betamethasone	China	<a href="#">NCT03279796</a>
Autologous Stem Cells in Achilles Tendinopathy	Achilles Tendinitis	Biological: Autologous Mesenchymal Stem Cells	UK	<a href="#">NCT02064062</a>
Treatment of Refractory Patellar Tendinopathy With Mesenchymal Trunk Cells. Comparative Study With PRP.	Patellar Tendinopathy	Procedure: mesenchymal stem cells   Procedure: Pure platelet-rich plasma	Spain	<a href="#">NCT03454737</a>
Effectiveness and Safety of Autologous ADRC for Treatment of Anterior Cruciate Ligament Partial Rupture	Anterior Cruciate Ligament Partial Rupture	Procedure: Liposuction   Device: ADRC isolation   Procedure: Arthroscopic surgery   Other: Intraarticular administration of autologous ADRC	Russia	<a href="#">NCT02469792</a>
<b>Degenerative Disc Disease</b>				

Title	Conditions	Interventions	Country	Trial Number
Autologous Adipose Derived Stem Cell Therapy for Intervertebral Disc Degeneration	DDD	Other: autologous adipose derived mesenchymal stem cell	South Korea	<a href="#">NCT02338271</a>
<b>Rotator Cuff</b>				
Mesenchymal Stem Cells in Rotator Cuff Repair	Rotator Cuff Tear Tendon Injuries Mesenchymal Stem Cell	Biological: Mesenchymal stem cell Procedure: Rotator cuff repair	Brazil	<a href="#">NCT03362424</a>
Clinical Study on Mesenchymal Stem Cells Used in the Reconstruction Surgery of the Supraspinatus Muscle Lesions	Rotator Cuff Tear	Biological: mesenchymal stem cells Procedure: without mesenchymal stem cells	Czech Republic	<a href="#">NCT03068988</a>
Efficacy of Microfragmented Lipoaspirate Tissue in Arthroscopic Rotator Cuff Repair	Rotator Cuff Tears	Procedure: arthroscopic rotator cuff repair Procedure: autologous micro-fragmented adipose tissue	Italy	<a href="#">NCT02783352</a>
Treatment of Tendon Injury Using Allogenic Adipose-derived Mesenchymal Stem Cells (Rotator Cuff Tear)	Rotator Cuff Tear	Biological: allogenic adipose stem cell treatment	South Korea	<a href="#">NCT02298023</a>
Mesenchymal Stem Cell (MSC) Included in OrthADAPT Membrane for Rotator Cuff Tears Repair	Rotator Cuff Tear	Biological: Mesenchymal Stem Cells (MSCs) Biological: OrthADAPT	Spain	<a href="#">NCT01687777</a>

**APPENDIX H. Clinical Expert Peer Review**

Zorica Buser, PhD

Assistant Professor of Research Orthopaedic Surgery and Neurological Surgery

Department of Orthopaedic Surgery

Keck School of Medicine

University of Southern California

1450 San Pablo St, HC4 - #5400A

Los Angeles, CA 90033

Patrick C. Hsieh M.D.

Professor of Neurological Surgery

Edwin M. Todd/Trent H. Wells, Jr. Professor of Neurosurgery

Department of Neurological Surgery

Keck School of Medicine

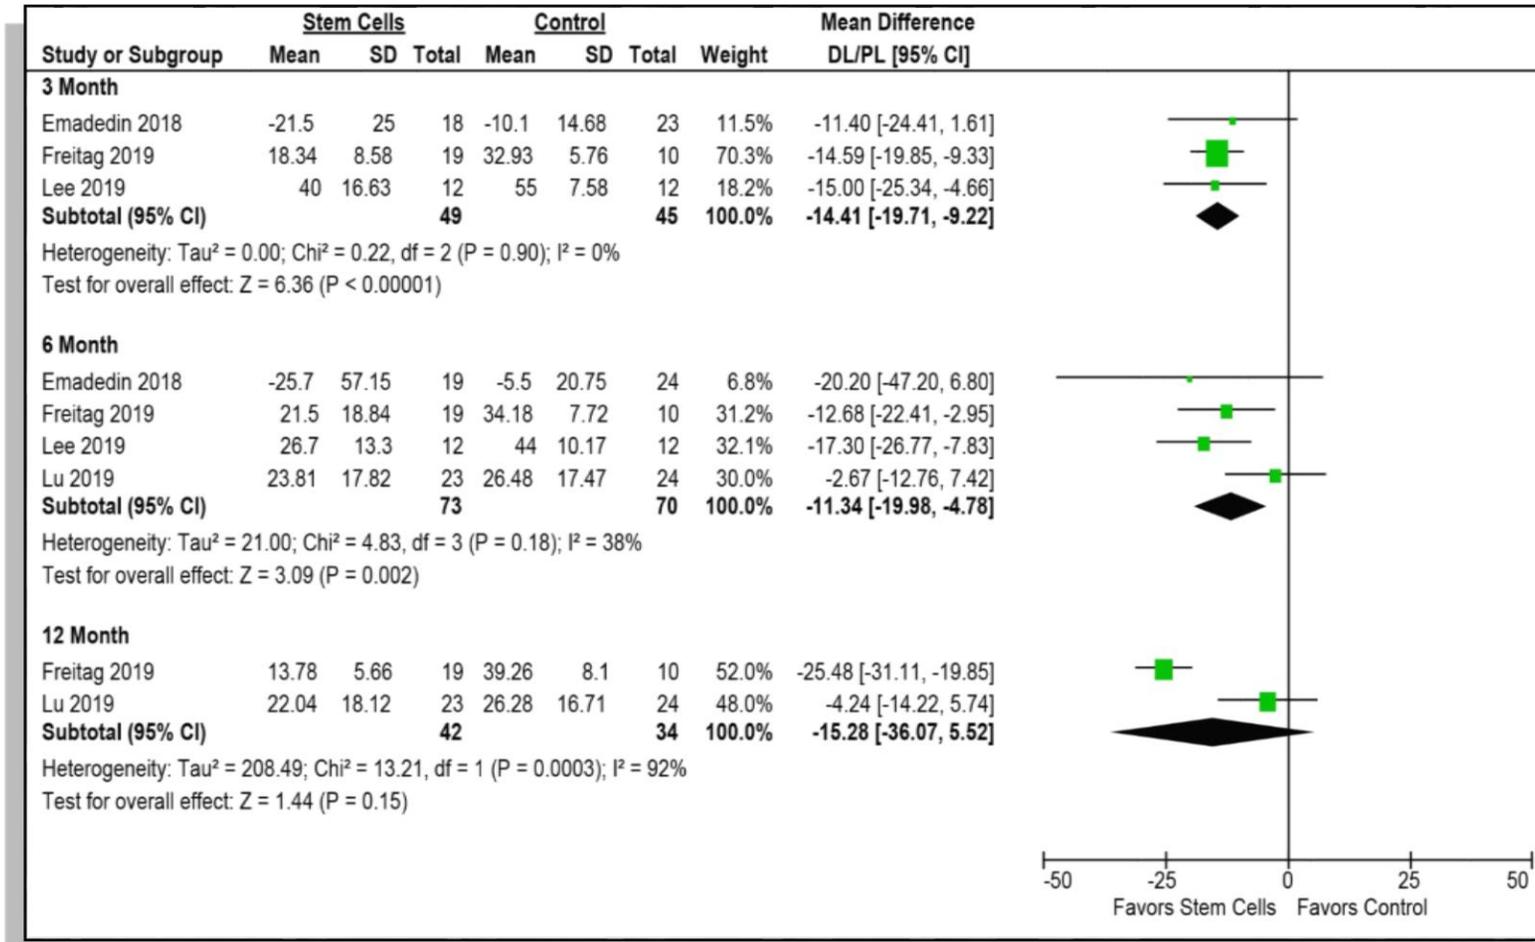

University of Southern California

1200 N. State Street, Suite 3300

Los Angeles, CA 90033

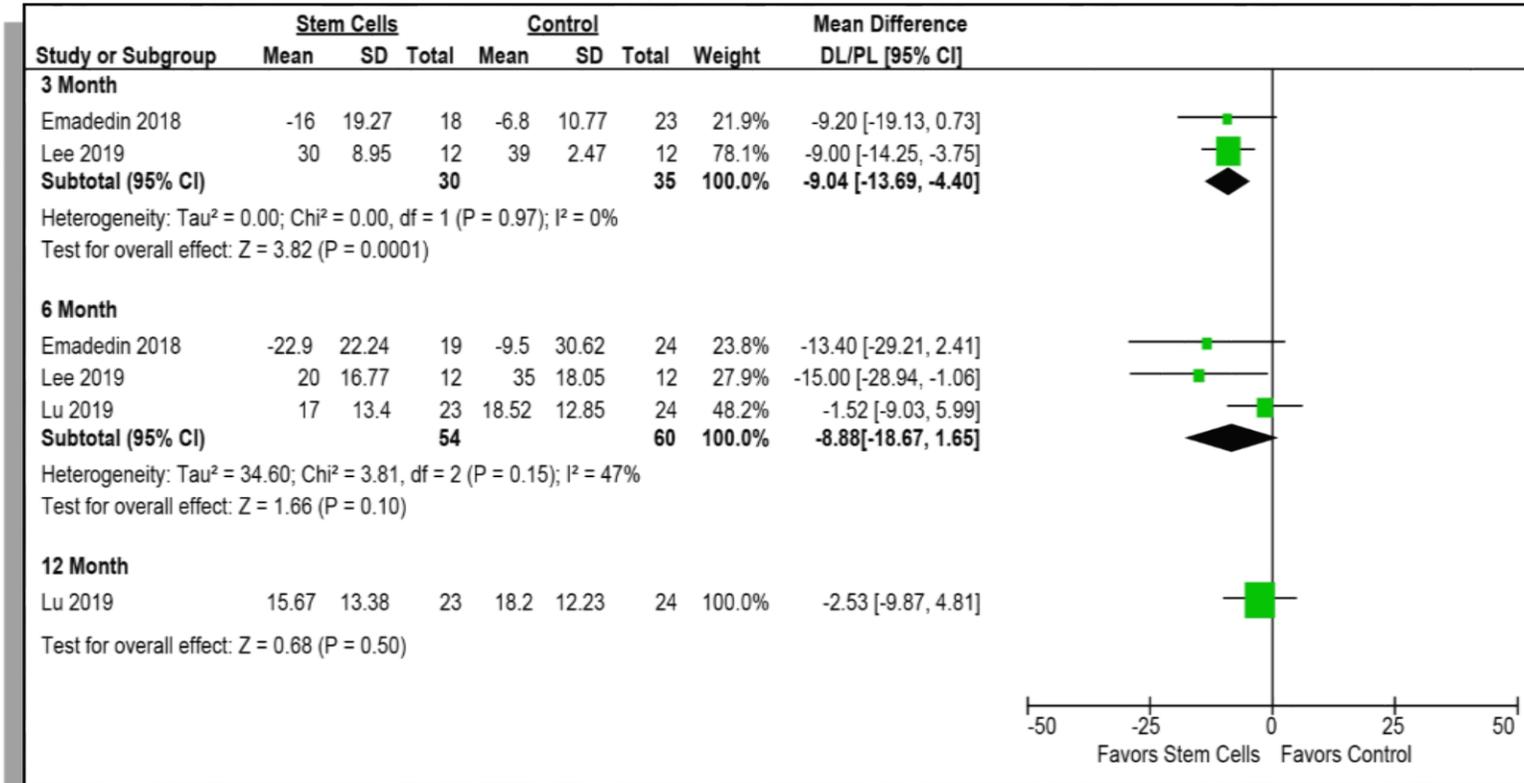

**APPENDIX I. Sensitivity Analyses for outcomes from RCTs evaluating autologous, culture-expanded stem cell therapy for the treatment of knee OA**

**Appendix Figure I1. Autologous, culture-expanded stem cells for knee OA – sensitivity analysis of the WOMAC total follow-up scores from RCTs excluding Lamo-Espinosa 2016/2018.**

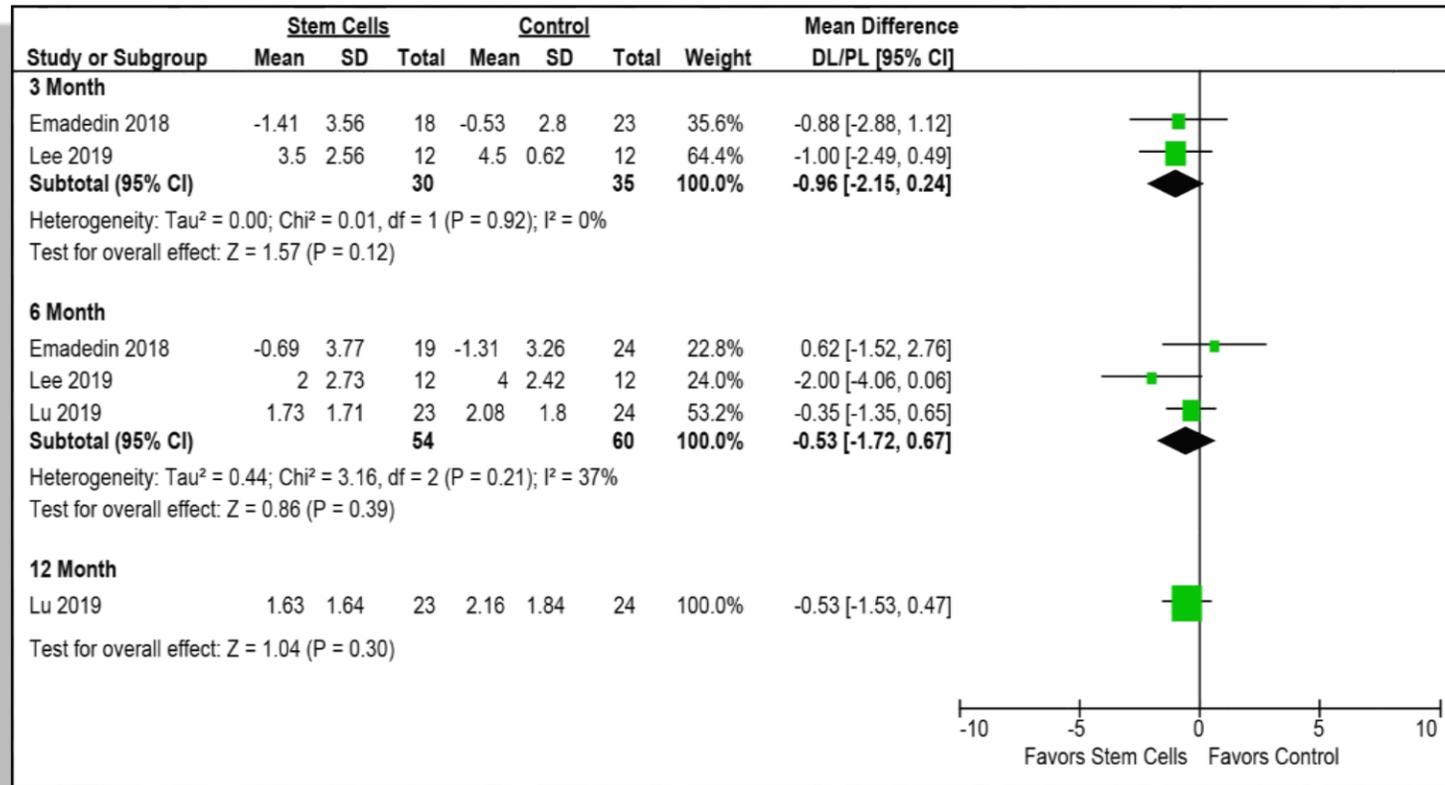

AD-MSC: adipose-derived mesenchymal stem cells; AD-MPC: adipose-derived mesenchymal progenitor cells; BM-MSC: bone marrow-derived mesenchymal stem cells; CI = confidence interval; HA = hyaluronic acid; Mod = moderately; OA = osteoarthritis; RoB = risk of bias; SD = standard deviation; UC = usual care (i.e., conservative care); WOMAC = Western Ontario and McMaster Universities Osteoarthritis Index.

**Appendix Figure I2. Autologous, culture-expanded stem cells for knee OA – sensitivity analysis of the WOMAC physical function follow-up scores from RCTs excluding Lamo-Espinosa 2016/2018.**

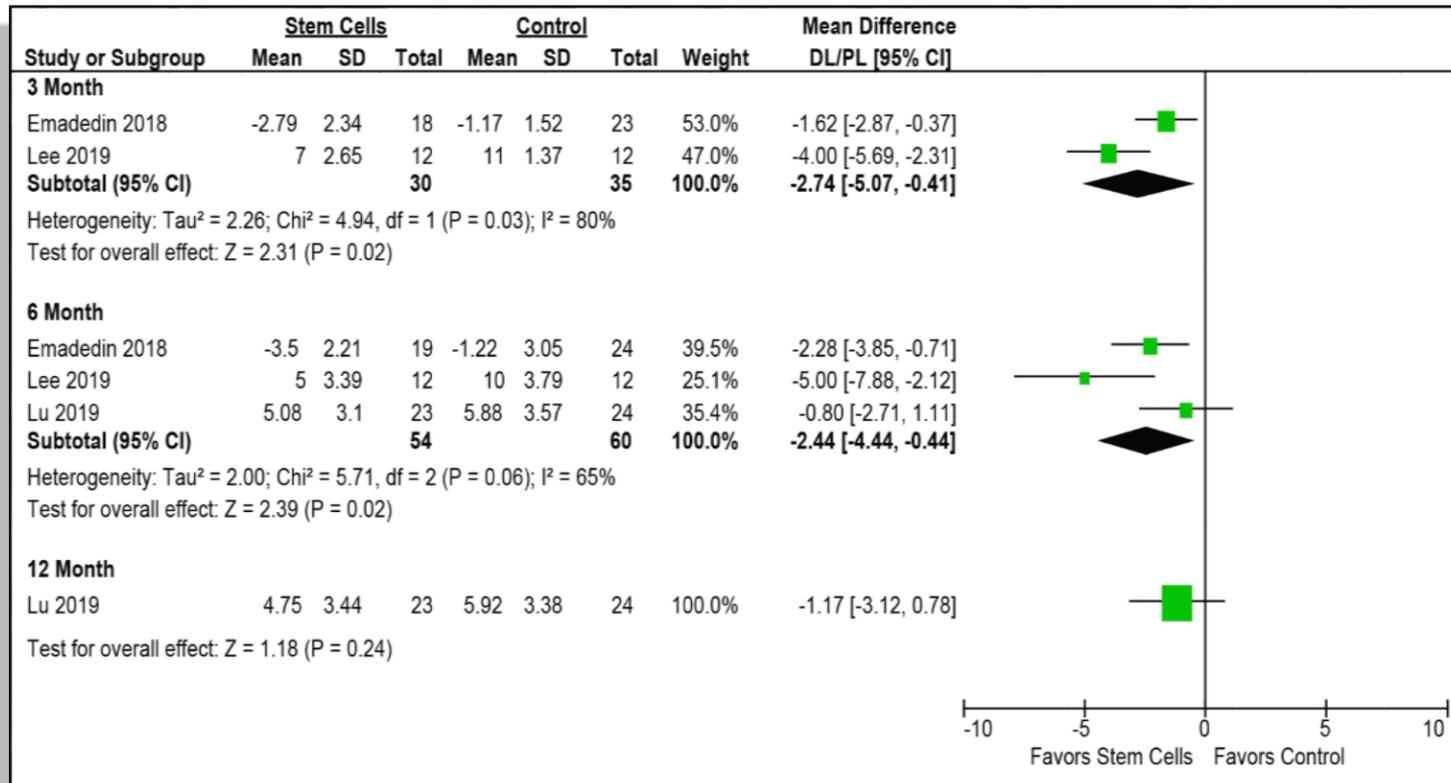

AD-MSC: adipose-derived mesenchymal stem cells; AD-MPC: adipose-derived mesenchymal progenitor cells; BM-MSC: bone marrow-derived mesenchymal stem cells; CI = confidence interval; HA = hyaluronic acid; Mod = moderately; OA = osteoarthritis; RoB = risk of bias; SD = standard deviation; WOMAC = Western Ontario and McMaster Universities Osteoarthritis Index.

**Appendix Figure I3. Autologous, culture-expanded stem cells for knee OA – sensitivity analysis of the WOMAC stiffness follow-up scores from RCTs excluding Lamo-Espinosa 2016/2018.**

AD-MSC: adipose-derived mesenchymal stem cells; AD-MPC: adipose-derived mesenchymal progenitor cells; BM-MSC: bone marrow-derived mesenchymal stem cells; CI = confidence interval; HA = hyaluronic acid; Mod = moderately; OA = osteoarthritis; RoB = risk of bias; SD = standard deviation; WOMAC = Western Ontario and McMaster Universities Osteoarthritis Index.

**Appendix Figure I4. Autologous, cultured-expanded stem cells for knee OA – sensitivity analysis of the WOMAC pain follow-up scores from RCTs excluding Lamo-Espinosa 2016/2018.**

AD-MSC: adipose-derived mesenchymal stem cells; AD-MPC: adipose-derived mesenchymal progenitor cells; BM-MSC: bone marrow-derived mesenchymal stem cells; CI = confidence interval; HA = hyaluronic acid; Mod = moderately; OA = osteoarthritis; RoB = risk of bias; SD = standard deviation; WOMAC = Western Ontario and McMaster Universities Osteoarthritis Index
